We are told the improvement in running is wonderful, and that only a very small drip of water is required to keep the metal cool and to allow for evaporation. The device is certainly extremely simple, and can be tried by anyone.

## POST-WAR PROGRAMMES.

### Further Advance Particulars of New Model Motor Cycles.

**I**N spite of the Order relating to the manufacture of new motor cycles, firms will continue to make plans for after-the-war production. Arranging a well thought out programme will not interfere with their present munition work, but it will place them in a good position, when hostilities cease, to get to work immediately, and save valuable time.

The Ixion Motor Manufacturing Co., Ladywood, Birmingham, intend concentrating on their two-stroke models after the war, and have decided to fit a clutch and two-speed gear to both the ladies' and men's models, in place of hub gears previously used.

#### A Spring Frame L.M.C.

The L.M.C. Co., of Monmouth Road, Birmingham, have decided to fit as an after-the-war production a spring frame to the 6-7 h.p. twin-cylinder model. This embodies an old design of Mr. Lloyd's which he introduced some years ago, but we are not at liberty to say anything further concerning it beyond the fact that it was proved to be a practical and sound design in the early days. With improvements which experience has provided, it will doubtless be eagerly sought for by this firm's Colonial clientele. The L.M.C. will be built on the clean and solid lines of English machines, with particular attention to special Colonial requirements, such as high engine clearance, large

capacity tank (not necessitating any alteration to seat level, which will be as low as before), spring frame, round base rims, 28in. x 3in. tyres, and the L.M.C. spring fork reconstructed. A three-speed countershaft gear will be incorporated, and a specially-designed sidecar chassis made to suit the spring frame.

The 4½ h.p. single-cylinder model is to be redesigned.

#### Levis Lightweight and Flat Twin.

A new Levis post-war two-stroke model will be called the Baby 2-3 h.p. This is the 60x70 mm. Levis which in several hill-climbing and other competitions was officially referred to as a 1.9 h.p. There were only six of these machines built for competition purposes, but after the war the model will be standardised as above. The engine will be the result of experience gained from the model which won the Calthorpe Hundred Guinea Cup Trial. The 2½ h.p. model E and the 2¼ h.p. Popular will also be continued.

With regard to the twin-cylinder horizontally-opposed two-stroke 4.2 h.p. model, it is proposed to fit this to a duplex frame and also a dropped top tube frame. We saw some of these 4.2 b.p. engines running on test. They are attached to a bed which is not fastened down in any way, yet with the engine revolving there is an entire absence of vibration. They should make an ideal two-stroke for a sidecar outfit, and we

look forward to their introduction at a later date.

#### Druid Forks.

The post-war arrangements in connection with the Druid fork show that the makers intend to keep pace with engine power by strengthening the fork of the 3½ h.p. single-cylinder model and improving it in all details. It was most strongly emphasised that this firm does not believe in grease lubricators for the various joints of the fork, the reason being that from their experience grease hardens through exposure to the weather, and that more often than not it causes the seizure of a bearing, which may result in the end of the spindle being twisted off. In all forms of spring fork made on the lines of the Druid, there is a certain amount of lateral play which cannot be avoided, and in the opinion of the makers the best method of taking up this wear is to supply thin washers for insertion between the faces of the joint. They also recommend in all cases that oil should be used for lubrication, and not grease. The experience they have gained during the past is, of course, enormous, as there are a very large number of machines in use fitted with Druid forks.

With regard to the foregoing advance details of after-the-war plans, it is, of course, useless for readers to make enquiries of the firms in question, as it is impossible to give deliveries yet awhile.

## DEVICE FOR USING HEAVY FUEL.

**W**E have received from Mr. H. Locke, of Manchester, a description of a device he has adopted on his 3½ h.p. fixed gear Premier for the utilising of heavy fuels. The machine has a Senspray carburettor, was originally fitted with tank-controlled magneto, and to obviate the ugliness of a spare tank

hole was drilled in the induction pipe and a clip placed around. This device was made controllable from the handlebars by Bowden mechanism, a third lever being fixed on the top of the standard controls.

By this means the machine was made capable of running on pure paraffin with extreme flexibility. The speed is by no means slow, fifty-seven miles per hour

having been obtained without undue effort, so we are told, and six miles per hour on a 3½ to 1 gear without a knock.

The mudshield is extremely efficient, and was made from 22 gauge tinned sheet iron, the edges being bent round 1½ in. iron wire, and the whole being given three coats of enamel. An opening was cut in the shield, which allows the air current to impinge against the cylinder.

Sketch of clip which rotates round the induction pipe uncovering extra air intake.

clipped on the top tube the owner fixed one in one of the pannier bags, and made the tube to run direct to the jet. Thus an easy start can always be made, no matter what fuel is in the carburettor.

The petrol is simply turned on and the jet flooded. After the engine fires the paraffin can, of course, be used.

To obtain slow running on the heavy spirit it was found necessary to use a larger jet and higher level; also, several ganges were placed in the induction pipe to assist the vaporisation.

The big jet, however, caused overheating, and to overcome this an extra air

Mr. H. Locke's Premier, showing toolbag used as a casing for the spare petrol tank. Note efficient mudshield.

## Despatch Carrying in German East Africa.

The men whose duty it is to carry messages on motor cycles between posts often hundreds of miles apart, and frequently quite alone in this wild country, have strange stories to tell, and the following short article graphically describes a few of the trials these brave motor cyclists cheerfully endure.

HE was gathering a few dried sticks preparatory to making a fire when I called him over and invited him to use our Primus to boil his billy can. Accepting with thanks, he put his tin on the stove, and then set about getting his blankets down for the night.

"He" was a South African despatch rider attached to our M.M.G.S. armoured car, which at that time was acting as a "mobile blockhouse" on outpost duty.

In this distressful country the army is nearly always on the move, and the D.R. has no base billet to return to each night. He must carry absolutely every atom of his kit and equipment with him, and the luggage carried on my new friend's B.S.A. would have made some of our home riders open their eyes.

### An Extensive Kit.

Firmly strapped across the carrier were a large kit-bag and a roll of blankets done up in a waterproof sheet, surmounted by a mess-tin and a tin of "bully." On the near side a spare belt was coiled up under the pannier bag, and on the off side a despatch and map case. The saddle down tube carried a spare inner tube in its leather case and a spare water bottle. Bags holding flour, coffee, and sugar were tied to the handle-bar, together with an enamel drinking mug and a tin of beef fat. Attached to the front fork was a long rifle holster, in which were a rifle and signalling flags, while on the other side of the fork were a native spear and a bow and arrows—souvenirs. A spare pair of puttees wrapped round the tank served as knee-grips.

The rider himself—a tall, well-built, sun-brown Colonial—wore just a tunic shirt, open necked and with sleeves rolled up, and riding breeches and leggings. On the road he carried water bottle and haversack on either shoulder, with his knife, spoon, and fork shoved down the top of one legging and pipe down the other—decidedly unpleasant articles to fall on in the rather likely event of a spill.

After tea or dinner, or whatever you like to call a meal of bully, coffee, and dough cakes fried in fat—our staple food out here—we sat together on the back of the car, and, with pipes pulling well on sweet Boer tobacco, exchanged motor cycling experiences. He told me that the D.R.'s Corps was recruited at 5s. 6d. a day about the beginning of this year, and after very little training landed in G.E.A., all equipped

with new B.S.A.'s. The majority of the men had been through the German West African Campaign.

### British and American Machines.

"Of course," he said, "you fellows out from home feel these roads far more than we do. They have plenty of roads in S.A. with six inches of sand like these, but you are used to riding on billiard tables. Woh! how low your cars are!"—(I recalled a few merry moments when our Rolls-Royce had sat on its under-shield and running boards in the mud, with its wheels gaily whizzing round)—"and the bicycles hit their crank cases on twigs in the road. The Americans are much better in this respect, and that is why they are so popular down below. Still,

on the whole, we prefer English makes; they are so well made. See how these have stood up to it!"—nodding his head towards the B.S.A. "It's a terrible load they've got, especially over these roads, but now we trust 'em more than horses. Wish the clutch were on the handle-bars, all the same, and I've had to bend the bar out, too.

### Joining up Again.

"Almost all of us are going to come home to join up again and see what France is like after this. I wonder what sort of a job despatch riding is over there; out here we have to cook all our own 'scoff,' such as it is, never seeing a trace of civilisation, and riding through the sandy bush for hours on end. But I suppose slithering through shell fire all day must be very merry hell. Naturally, we get our share of excitement here. There is always the danger of the Askari potting you from the bush, and only a few days ago I was riding alone in the early morning, and came across a lioness and two cubs lying in the road. You should have seen me shin up a baobab tree at the double!

"My longest run? I once did from X—to Y—that's 300 miles, on my own in three days. That was before the roads had been so badly cut up, though. We usually do about forty miles a day when with the column. Do you happen to have any motoring papers from home, by the way? Have not seen one for years, it seems, and I used to be very keen on following the trials and things at home. *The Motor Cycle*—thanks very much. Move off five o'clock, don't we, Right ho! Good night, old man. Give me a shake if there's anything doing in the night." MILES.

A MOTOR CYCLIST D.R. IN GERMAN "EAST."

An equipment worthy of the name. A load frequently carried hundreds of miles by despatch riders in German East Africa. All available space is utilised, even the gap at the top of the leggings, where knife, spoon, fork, and pipe are snugly carried.

A selection of questions of general interest received from readers and our replies thereto. All questions should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, London, E.C., and whether intended for publication or not must be accompanied by a stamped addressed envelope for reply. Correspondents are urged to write clearly and on one side of the paper only, numbering each query separately, and keeping a copy for ease of reference. Letters containing legal questions should be marked "Legal" in the left-hand corner of envelope, and should be kept distinct from questions bearing on technical subjects.

### Jet Sizes.

**Q.** (1.) How are the jets numbered for B. and B. and Senspray carburettors? Are the higher numbers larger in size than the lower numbers, or vice-versa? (2.) How many miles per gallon ought I to get from a  $3\frac{1}{2}$  h.p. single-cylinder machine with three-speed gear and coachbuilt sidecar? The machine is fitted with Senspray carburetter, No. 40 jet, and I am getting eighty miles per gallon, carrying one passenger. I usually travel a little over twenty miles per hour. Is this result good? (3.) Would results be as good with a 5-6 h.p. twin combination?—W.J.U.

**A.** (1.) The numbers marked on most carburettors represent thousandths of an inch. Consequently the larger the number the larger the jet. (2.) The mileage you are obtaining is quite good. (3.) No, we do not think you would obtain such a large mileage per gallon.

### Knocking.

**Q.** My machine is a recent pattern 6 h.p. twin-cylinder sidecar combination, and has recently taken to knocking. Knocking occurs on hills, and on very slightly rising ground when the throttle is opened after slowing. The machine has travelled only about 600 miles, and I am wondering whether the trouble is due to causes other than carbon deposit. For a very little movement of the throttle lever the slide seems to me to open a good deal. In these conditions, if the throttle lever were opened quickly after slowing, would this be likely to cause the trouble? I have only recently been troubled, and until I heard it on this machine did not know what a "konk" was. The engine is extremely difficult to turn round when cold, necessitating a copious priming with petrol. I fear that this is likely so to dilute the oil as to render it inefficient as a lubricant. What can be done?—A.J.H.

**A.** The trouble cannot well be due to carbon deposit, as you have run so short a distance, and so it is a little early to expect carbon deposit to cause knocking. Have you tried closing the air when knocking begins? A partially choked jet will also cause knocking. Make sure the engine receives sufficient oil. It may also quite well be due to the use of an unsuitable plug or plugs which cause pre-ignition. If you use a good single-point plug of first-class manufacture this should cure the trouble. Opening the

throttle quickly after slowing up might cause knocking if you did not first retard the spark. Injecting petrol does not dilute the oil, because as soon as the engine warms up the petrol evaporates.

### Clutch and Gear Box Lubrication.

**Q.** I have a 1916  $4\frac{1}{2}$  h.p. combination, and shall be glad of your help in regard to clutch lubrication and brakes. The makers recommend their "special lubricating oil" for the clutch and gears, but I have not been able to obtain this, and have been given (by a local repairer) a tin of Mobiloil T.T. This seemed satisfactory at first, but afterwards there was difficulty in getting the clutch to free, and I concluded that the oil was too thick. After flushing out with paraffin and refilling with two parts of T.T. and one part of paraffin (to thin the lubricant down) I have obtained satisfactory results up to the present. I am anxious to know if there is any objection to thinning the oil with paraffin, and, further, could not I use heavy cylinder oil, say, diluted with equal parts of paraffin for the gear box and clutch, and so save having to keep two grades of oil on hand?—J.V.G.

**A.** Engine oil thinned down by means of paraffin is perfectly satisfactory for metal plate clutches. If too fierce, add more oil, and if not sufficiently fierce, add more paraffin. The gear box should be lubricated with a very heavy oil—the heavier the better. It would, therefore, not be really suitable for the clutch unless much diluted with paraffin. Do not add paraffin to the oil for the gears.

### THE BRITISH MAGNETO AND "THE MOTOR CYCLE."

Those motor cyclists who have the interests of their country at heart will be interested in a booklet which is now ready, reviewing the efforts of "THE MOTOR CYCLE" in fostering a British magneto industry. It is well to recall that "THE AUTOCAR" and "THE MOTOR CYCLE" were the only two journals which, BEFORE THE WAR, openly exposed the fact that the British motor trade was entirely dependent upon German magnetos. We shall be pleased to supply a copy of this pamphlet to any motor cyclist who cares to make application to the Editor.

### Imperfect Combustion.

**Q.** I have a  $3\frac{1}{2}$  h.p. 1914 motor cycle fitted with a B. and B. automatic carburetter. I find that after a run, either a long or short distance, on taking the carburetter down, there is a quantity of petrol in the induction pipe. Should this be so? I have tried to remedy this by raising and also lowering the shoulder on the carburetter needle, but it makes no difference, except in the matter of the engine requiring more air or less air, as the case may be; but the petrol still lies in the induction pipe. Ought this to be so? If not, please tell me what is wrong. I may say I only get between fifty and fifty-eight miles per gallon with a sidecar.—G.D.

**A.** No; there should be no unvaporised petrol in your pipe. The trouble will undoubtedly be cured by fitting a warming pipe to the carburetter, so that the fixed air is taken in hot. This should also improve your consumption. The whole carburetter system should be kept as warm as possible, including the induction pipe; this might be lagged with several layers of insulation tape to prevent radiation of any heat.

### Popping Back through the Carburetter.

**Q.** I should be obliged if you would tell me the reason for my 1914 7 h.p. twin popping back through the carburetter. I am running on 50% mixture of petrol and petrol substitute. In extracting a bent exhaust valve from the front cylinder I had the misfortune to break the valve guide about  $\frac{1}{4}$  in. below the cylinder head. Would this lead to its popping back? The engine will take no extra air at all, though I have banded all the carburetter unions with insulating tape.—G.S.A.

**A.** There are many reasons for the trouble of which you complain in your letter, such as the possibility of impurities in the petrol substitute (but this is not likely), to the air entering the carburetter not being warm enough, or, very possibly, the trouble might be caused by a partially stopped jet, especially the pilot jet, or to the level in the float chamber being too low. The level should come to a point just below the top of the jet. It is hard to say if the breakage of the valve guide would cause the trouble, but provided the valve closes properly and there is a fair length of guide left it is hardly likely that this would allow of the leakage of sufficient air to cause the popping back.

**Refusal to take Air.**

**?** Since adjusting the control wires of my carburetter I find the engine will not take as much air as previously without misfiring or stopping. What would be the likely cause?—W.D.

The fact that the engine will not take as much air as previously may be due to an air leak at the induction pipe or carburetter unions, or to a partially choked jet. It is, of course, possible that the engine actually takes as much air as it did, but the alteration in the control wire renders the position of the levers different for a given opening. If this is the cause, it may be found that the carburetter will now take a slightly larger jet, as the air slide now opens further.

**Liability for Accident.**

**?** Will you kindly give me advice on the following accident, which occurred on the highway in Meopham Parish, Kent: I was passing with my motor cycle and sidecar on the right-hand side where the Kent County Council was repairing the centre of the road. The road was 18ft. 10in. wide, with a rough high bank each side. The part of the road in repair was 6ft. wide, and had been broken up with lumps of stone, and men were working on it. Between the broken road and the bank on the right-hand side where I passed it was 6ft.; on the left-hand side 6ft. 4in. As I was passing the foreman was at work on the edge of the broken road. My sidecar mudguard and wheel knocked his leg, rendering him unfit for work. I was running the machine on low gear, and travelled at low speed, sounding a 7in. foot bell for a long distance. He was apparently unable to hear, as he is deaf. Finding he did not move, I steered my machine so that the footboards touched the bank, to try and avoid the accident. Now he wants me to pay 17s. per week all the time he is laid up. Do you think I should be justified in doing so?—E.W.

We submitted your query to our legal adviser, who replies as follows: "It certainly seems to me that, even if there was any negligence on the part of your correspondent, the man who was knocked down was guilty of contributory negligence. He knew of the difficulties in connection with the road, and, in spite of the fact that he was deaf, he was working in a dangerous position close up to the edge, apparently without troubling to see whether anything was coming. At the same time, it is always very difficult to know just what conclusion a judge or jury would come to with regard to facts similar to those disclosed. It is, of course, quite clear that a driver must take into account that persons in the road may be deaf, or blind, or drunk, and it would be very easy for it to be held that your correspondent should have been going so slowly through this narrow part that she could have pulled up without colliding with this man. She does not say how many weeks the man has been laid up. If the claim is only a small one, or it is possible to settle for a reasonable amount, it would be much better than running the risk of an action."

**Speedometers and Tyre Sizes.**

**?** I shall be extremely obliged if you will tell me, if I transfer a speedometer from a motor cycle fitted with 26in. x 2 1/2in. tyres to one equipped with 650 mm. x 65 mm. tyres, what difference it will make in registering the mileage and speed.—F.T.R.

With the 650 mm. x 65 mm. tyres you will get a very slightly higher reading; but we do not fancy the difference will be sufficient to be noticed, or cause any real inconvenience.

**Noises in Engine.**

**?** I should be much obliged if you would give me your opinion re the following: My machine is a 1915 5-6 h.p. twin Hazlewood-Jap. A bumping sound has set in, together with a dull scrape. The former occurs at speed; the latter at any time. I dismantled the machine, and found side play, very slight, but sufficient to cause the flywheels to bump against the crank case. There was no direct end play to the connecting rods, but more perceptible rock in the back than in the front. The scrape is evidently against the oilguard for the back cylinders. It is slight but annoying. (1.) Will it do any harm if allowed to continue? (2.) Would a washer or small bush fitted on the main driving-shaft chain side inside crank case put matters right regarding the bump. (3.) Should I have the big end rebushed to take up the rock as above? (4.) As I use the machine for business purposes daily, wet or fine, how long would the repair take and probable cost? (5.) The machine has wonderful power and speed in spite of the above; but when it is running slowly on top or second with the throttle one-quarter open (or less), and air in any reasonable position, a choke sets in, causing the machine to proceed in jerks.—W.T.

You should make sure that the flywheels are not loose on the shaft. This might easily cause the symptoms you mention, though when the engine is down you might not readily notice the looseness. Try a thin washer on pulley side and gear side spindles, which will prevent any

end play. (1.) If the trouble is caused as you say, no damage will be done. (2.) Probably not unless there is clearly undue end play. (3.) This would be the best course, but should not be necessary unless there is considerable end play. (4.) We cannot tell. Ask the repairers for an estimate both of time and cost. (5.) Possibly this is caused by an air leak, causing misfiring.

**READER'S REPLY.****Bournemouth to Cheltenham.**

This alternative gives easier gradients, less tortuous road, equally good surfaces, and the mileage is almost identical. The writer knows both routes well, and the scenery is equally interesting. Bournemouth, Christchurch, Ringwood, Ford- ingbridge, Salisbury, Wilton, Madding- ton, Tilshead, West Lavington, Devizes, Chippenham, Malmesbury, Cirencester, Cheltenham.—R. PEARCE.

The latest model of a curious American design known as "The Militaire." It is another attempt at a car on two wheels. A single-cylinder engine supplies the power, while the appearance of the large casing under the seat seems to suggest that friction drive is the type of gearing employed.

## A 5 h.p. BROUGH FLAT TWIN.

An Entirely New 692 c.c. Model, the Latest Production of the Brough Factory, the Outcome of Several Years' Experience with Horizontal Twins.

AT the present time, as will have been gathered from recent issues of *The Motor Cycle*, there is something akin to a boom in "flat twins," as we have styled these horizontally-opposed engines. Some twelve machines are already well known to the motor cycling public, and among them the productions of Messrs. W. E. Brough and Co., of Basford, Nottingham.

The  $3\frac{1}{2}$  h.p. model of the firm, or, as they are pleased to call it, "The Pup," has proved its worth, not once, but many times, in competition, and it speaks well for the machine that it seldom appears in the second-hand market, and when it does, always commands a very high figure.

The larger machine now makes its appearance in an improved form, and, without overstating the case, we may say that it is a very fine product in every way, but, unfortunately, for the present, it is not obtainable, for the simple reason that Messrs. Brough are much too busy on important Admiralty work, which must not be delayed or interfered with in any way. The 5 h.p. flat twin must remain in being only, so far as two or three models are concerned, awaiting

the termination of the war, when it will take its place as a standard model. Messrs. Brough are convinced of the superiority of flat twins over singles, and this after extensive experience over a period of twenty years of engine manufacture.

The specification of this outfit, for it is intended to be sold as a complete combination with a new flat twin Brough, specially de-

Threequarter rear view, showing the rotund shape of the body, designed to accommodate tools and spares without disturbing the passenger.

Connecting rod of the new flat twin Brough, showing split big end.

signed sidecar, may briefly be stated thus:  
CYLINDERS.—Horizontally-opposed, each  $70 \times 90$  mm. = 346 c.c.

TRANSMISSION.— $\frac{1}{2}$  in. chain to countershaft, Sturmey-Archer three-speed gear, and  $1\frac{1}{2}$  in. belt to driving wheel.

MAGNETO.—Thomson-Bennett.

CARBURETTER.—Caudel-Hobson, with hot air jacket.

Frame of special design, rendering removal of cylinders an easy matter, leaving the crank case *in situ*.

Splash lubrication by drip feed.

### Features of the New Engine.

The cylinder casting of the new 5 h.p. engine is a fine piece of work, the fins being arranged horizontally on the cylinder itself and "herring boned" over the

A cylinder of the latest Brough, showing air passage in cylinder to assist in cooling the valve pockets. Note herringbone fins.

Power unit of the latest 5 h.p. flat twin Brough, from which the clean design will be appreciated. Notice the hot air collector for the carburetter.

valve pockets. Between the pockets is an air passage to assist cooling. The cylinders are staggered to the extent of one inch, and bolted to a very cleverly designed crank case casting in aluminium. The latter is entirely in one piece, with a large cover plate forming the off side of the chamber and secured by twelve nuts. All corners and edges are rounded, and particular attention given to making the engine unit as clean and plain in its lines as possible. Absence of dust-collecting corners and general simplicity have always been the striking features of the smaller

### A 5 h.p. Brough Flat Twin.—

Brough machine. Lubrication is very efficient, the oil being fed directly over the big ends, and dropping into the crank case, to be utilised again on the splash system.

Piston of the new "5," which has two rings at the top, one at the bottom, and a "keeper ring" for the gudgeon pin.

The valves are placed horizontally, side by side, above the cylinders, are of large diameter, and easily accessible in either cylinder. The whole power unit is held rigidly in the frame. The back part of the frame is carried underneath the crank case, and the front down tube carries the crank case at the top, which arrangement facilitates the ready removal of either cylinder. The crankshaft is well balanced and of substantial design, as also are the connecting rods, which latter have the usual crank type big ends. The piston has two rings at the top and one at the bottom, with a keeper ring over the gudgeon pin.

The Thomson-Bennett magneto, placed above the crank case, is gear driven. It is interesting to note that Messrs. Brough have been fitting this magneto from the early days of the war in place of the Bosch, and it has given entire satisfaction. The usual outside flywheel is fitted, with the chain sprocket on the outer side connecting the power *via* a half-inch chain to the standard Sturmey-Archer gear and clutch (handle-bar controlled).

The exhaust is carried by easy sweeping pipes into a cast aluminium box

carried under the crank case. No baffle plates are used, but the engine runs very quietly.

### The Frame.

The head of the frame is particularly strong, and has cast integral with it two lugs for sidecar attachment. The forks are specially made, the main blades being very wide. Two gallons of fuel may be carried in the tank, whilst the oil compartment is partitioned off in the centre of the right hand side, the control being by plunger pump and visible drip feed.

The sidecar is of special design, being roomy and having a capacious locker at the rear end. That the springing is efficient and well thought out we were able to prove later during a short run on the rough suburban roads of Nottingham. The sidecar is being made especially for this machine by the Derwent Sidecar Co., of Borrowash, Derby.

Balanced crankshaft of usual design, with cranks set at 180 degrees.

After a thorough examination of the machine we were invited to take a trial trip in the sidecar. The first noticeable feature was acceleration; as soon as the gear is changed from low to top the speed jumps to 25 m.p.h. in a few yards, and this speed can be maintained on a give-and-take road on a mere whiff of gas, whilst the quiet purr of the engine is very pleasant. But as the throttle is opened the big reserve of power is drawn upon, and very high speeds, for a sidecar combination, can be maintained whenever the road permits; 45 m.p.h. is easily reached on deserted stretches of road. No doubt 50 m.p.h. can be attained without undue effort, and this, with rider and passenger of normal weight, about 12 stone

each. The engine can be throttled down to about 10 m.p.h. on top gear, and it pulled steadily at this speed up a gentle rising gradient without labour.

The exhaust box design and its special brackets.

ing in any way. All horizontally-opposed engines show a marked reduction in vibration from that to which we have become accustomed on the single and V twin types; but this superiority is particularly noticeable in the Brough. It is excellently balanced, for even when revving fast on the stand the usual tremor was almost absent. Without doubt Messrs. Brough have perfected a splendid example of the horizontally-opposed engine, which will add greatly to the cult of the "flat twin."

### AVERAGE PRICES.

WE give below the average prices of second-hand models offered for sale in *The Motor Cycle*. Where it is possible to obtain a sufficient number of each model the average for the past week is quoted, otherwise the last average is given, if within four weeks.

The complete Brough sidecar outfit. A three-speed countershaft gear with combined chain and belt transmission has been adopted on this new model.

## ARTILLERYMEN'S "BATH TUBS."

PLANS are announced in the United States for the formation of a horseless regiment of heavy artillery, the guns to be hauled from point to point by caterpillar tractors, described as similar in construction to the "land Dreadnoughts" or "tanks" on the British Front.

It is instructive to learn that the artillerymen, who heretofore have ridden horses, will hereafter ride on motor cycles with "bath tub" attachments, each cycle carrying three men.

## AT GALLIPOLI AND SALONIKA.

WE recently had a visit from Lt. Cyril Paterson, the competition and racing motor cyclist. He joined the colours in October, 1914, and left this country in the summer of last year, hoping to get a commission in the R.E. He went to Gallipoli, and was in the furious fighting during the Suvla Bay landing, when the R.E.'s were employed as infantry. He was severely wounded, recovered at Cairo, was sent home for a brief space of time, and then joined the Salonika Expeditionary Force. He has seen fighting on the Somme, from which scene of operations he has just returned wearing the ribbons of the Military Cross and the Croix de Guerre. He mentioned that he had seen a despatch rider wearing his gas helmet and riding along a log road all out on a Triumph with T.T. handle-bars. This weird figure, he said, leaping from log to log, and swaying about in a most alarming manner, was like nothing on earth.

## D.R.'s AS AIR PILOTS.

WE have received a letter from an Australian D.R., who is the ex-secretary of the West Australian M.C.C. He tells us that during twelve months motor cycling in France, he met numerous Australians and New Zealanders who were either D.R.'s or drivers who have been sent home for a course of aviation. Many motor cyclists and drivers in the Flying Corps are being sent home for this course, their practical experience and knowledge of motors, and the nerve and dash that they acquire in the execution of their duties being considered of great assistance in the making of suitable pilots.

## THREE-INCH TYRES ON TRIUMPHS.

WE have received a further letter from the Front, emanating from a section using 3in. tyres on their War Office Triumph machines. Some doubt was expressed at first as to the possibility of fitting such a large tyre to a Triumph machine, on account of the clearance necessary. Our informant tells us that it is possible to put a 3in. tyre inside the standard mudguard, but not advisable. He himself rode a machine for some weeks in fine weather with the standard guard and a 3in. tyre, but the wheel clogged very easily as soon as the rain started. The writer further states that manufacturers of the different makes of motor cycles at the Front even now do not know what is wanted in the way of clearance. The

slight increases effected are inappreciable, and it only needs the right consistency of mud in France to bring a machine to a standstill—even a comparatively thin layer on *pavé* will do it.

## HEROES OF THE TANKS.

IN a list of war honours, containing twelve hundred names, published in the *London Gazette*, are the awards of the Military Cross to the following officers associated with the heavy armoured car tanks:

SEC.-LT. JOHN ALLAN manoeuvred his Tank with great skill under heavy shell fire over difficult and unknown ground, and brought it into a good position for enfilading the enemy's trenches, which he succeeded in doing with good effect.

SEC.-LT. FRANCIS J. ARNOLD commanded his Tank with great courage and determination. Later, the Tank being held up, he and his crew continued to fight with their revolvers.

SEC.-LT. E. C. K. COLLE fought his Tank with great gallantry, reaching the third objective. Later, on several occasions he went to the assistance of the infantry, and finally brought his Tank safely out of action.

SEC.-LT. A. H. BLOWERS on several occasions assisted the infantry and enabled them to advance.

LT. F. A. ROBINSON'S Tank got ditched, and he and his crew dug for fourteen hours under heavy fire, eventually getting the Tank out and back to the assembly point.

SEC.-LT. W. H. SAMPSON enfiladed an enemy trench and captured fifteen prisoners.

SEC.-LT. E. L. PURDY fought his Tank for five and a half hours with great gallantry, beating off continual enemy bombing attacks.

LT. A. E. ARNOLD went to the assistance of another Tank. He also rescued a wounded man, and, although himself wounded, brought his Tank safely out of action.

SEC.-LT. H. G. F. BOWN fought his Tank, which was disabled, with great gallantry, reaching his third objective. He put two machine guns out of action.

SEC.-LT. L. C. BOND in his Tank put a machine gun out of action and captured the team.

R.E. MOTOR CYCLIST DESPATCH RIDERS ATTACHED TO THE CLYDE DEFENCES.

Cpl. Heyes. L.-Cpl. Leonard. L.-Cpl. Burgin. L.-Cpl. Collins. L.-Cpl. Stewart. L.-Cpl. Service (artificer).

### TIMES TO LIGHT LAMPS.

GREENWICH TIME.

Nov. 23rd	...	...	4.31 p.m.
" 25th	...	...	4.28 "
" 27th	...	...	4.26 "
" 29th	...	...	4.24 "

### Dynamo Lighting for Solo Machines.

We hear of a new dynamo lighting set for solo machines which is all ready for the market, but cannot be manufactured at present, owing to the great demand for more urgent war material. We shall publish particulars at the earliest possible moment.

### The Simple Runabout.

The question of a simple form of runabout as an alternative to the sidecar combination is a constantly recurring topic. In Wednesday's issue of *The Light Car* there is a three-page illustrated article on the subject, wherein a number of the older patterns and some of the latest designs of cycle cars are reviewed and criticised.

### Death of a Gallant Motor Cyclist.

When the super-Zeppelin was brought down in Essex on September 24th, a young Essex farmer, a Mr. Alfred Wright, set out on his machine in the pitch darkness to call the military, but unfortunately he collided with a motor car and sustained injuries resulting in his leg having to be amputated. We greatly regret to learn that he has just died in hospital.

### Overseas Mails Lost.

We draw the attention of our Overseas readers to the fact that there were a number of Overseas mails on the *Arabia*, and we think it likely that there may be many letters on board addressed to *The Motor Cycle*, since we hear continually from Adelaide, Melbourne, Sydney, Straits Settlements, Ceylon, etc. Will Overseas readers kindly note, and duplicate any communications which may have been posted round about the dates announced in the press?

### Motoring in Switzerland.

We recently dined with M. Jules Neher, the managing director of Motosacoche, Ltd., makers of the famous M.A.G. engine, who was on a brief visit to England. He told us that there was a great scarcity of petrol in Switzerland, and that everyone had to use benzole, which gave great trouble in cold weather, as it froze much too easily. He told us, with great joy, that Motosacoche machines were now used exclusively by the Swiss Army. Though a neutral, M. Neher is very pro-ally in his sympathies.

### The Second-hand Show—Closing Scenes.

We paid a visit to the Agricultural Hall on Saturday morning, to have a glance at the second-hand show on its last day, and arrived just before the auction of the unsold cars and motor cycles began. This was in the hands of Mr. S. G. Cummings, who is well-known in the motoring world. There were few additions to the machines we reviewed last week, the most notable being a Carden cycle car, which appeared to be in good order. Bidding was not particularly brisk, as few people were present. Altogether the promoters of the exhibition are satisfied with the results, forty motor cycles out of ninety-two entered were sold, while the proportion of all vehicles sold was about 50% of the entries. That a show of this kind can be made a success, Messrs. William Glass and Co. are quite sure; so much so in fact that they have booked the hall for a date in March. If properly advertised before-hand, and held at a period when second-hand sales are looking up, we are inclined to share the promoters' confidence, as there is no doubt that, owing to the rarity of new goods and the consequent difficulty of obtaining them, any exhibition which helps the sale of second-hand motor cycles is likely to meet with success.

THE HEAVIEST MOTOR CYCLIST.

In our issue of Sept. 14th we reproduced a photograph of the tallest motor cycle agent in the world. It is a coincidence that the heaviest, Mr. Ove Bendixen, weighing 305 lb., should also live in the same city—Copenhagen. Mr. Bendixen is seen mounted on a flat twin Indian.

### SPECIAL FEATURES.

#### THE ALL-WEATHER MOTOR CYCLE.

By Dr. Rene Camus.

#### MANUFACTURE UNDER PERMIT.

Makers' Opinions and Experiences.

#### ANOTHER FLAT TWIN.

### The "All-weather" Motor Cycle.

This old topic is once again revived by the publication of an article in this issue, written by Dr. René Camus, of the French Army. Only two or three motor cycle manufacturers standardise efficient mudshields.

### 28 x 3in. Tyres on Triumphs.

In further reference to the paragraph regarding this subject in our issue of November 2nd, Pte. Barnett informs us that the tyres used were Dunlop 28 x 3 as fitted to American rims. He says that there is plenty of clearance for the larger tyres, and that not only is greater comfort obtained but the rims suffer less from damage through striking pot-holes at speed. This opinion does not tally with the letter reviewed in our military notes.

### A South African Record Route.

The Johannesburg-Durban Route seems to be keeping South African motor cyclists busy. No sooner are new figures set up than some rival starts out to beat them. We know not of the failures to beat records, but we do know that the original record of about 18½ hours has been pared down to 12 hours 33 minutes for the 421 miles journey. London-Edinburgh in 12½ hours is quite good going, but S.A. roads cannot be compared with British surfaces.

### Another Missing Motor Cycle.

Mr. W. H. Trevellich, of Barnet, informs us that his motor cycle has been lent under rather curious circumstances. On Wednesday afternoon, November 15th, a soldier called at his house and asked permission to borrow his motor cycle to ride into the town to obtain spares for his own machine, which had broken down, and which he had left at an inn in the neighbourhood. He at the same time left two "On His Majesty's Service" letters addressed to the War Office to be looked after till his return. The machine was lent, and has not been seen or heard of again.

The official envelopes, it appears, were found to contain sheets from a newspaper. The description of the missing machine is as follows: 1911 1½ h.p. Singer, with inclined engine, 1½ in. tyres, new Hutchinson on back, raised handle-bars, new filler caps, T11 marked on crank case.

**The New Prohibition Order.**

While visiting a motor cycle factory near London the other day, we were informed by the manager that he had applied for and obtained a permit from the Minister of Munitions to finish fifty-two partly completed machines.

**Flat Twins of Large Capacity.**

The value of the opinion of a writer in a contemporary to the effect that horizontal engines over 350 c.c. are not successful can be gauged from the fact that the following makers, among others, are now producing engines over the size stated: A.B.C. Motors, Ltd., W. E. Brough and Co., H. Collier and Sons, Ltd., Douglas Bros., and Humber, Ltd.

**Rover Company Balance Sheet.**

The profit of the Rover Co., Ltd., for the year ending August 31st is £61,097, which, with the amount brought forward, gives an available balance of £101,457 16s. 3d. A 10% dividend is being paid; which absorbs £11,224. To the general reserve is placed £20,000, war contingencies reserve £30,000, and the balance of £40,233 to be carried forward to next year. The Chairman (Col. W. F. Wyley, J.P.), in moving the adoption of the directors' report, mentioned that they had disposed of the motor cycle part of the business.

With regard to the above, the company referred to by Col. Wyley is the New Rover Cycle Co., Ltd.

**The Colombo Motor Cycle Volunteer Corps.**

We mentioned recently that a Motor Cycle Volunteer Corps was being formed in Colombo, Ceylon. The most recent news is that the detachment had their first "parade" on November 6th, outside the Racecourse, and took the oath before Capt. F. J. Hawkes, who is O.C. for the Colombo detachment. Afterwards he explained to them the work they were expected to do. "Their activities," he said "would extend over the whole of the island, acting, if necessity arose, as despatch riders. It would be essential for them to go through machine-gun drill, signalling, infantry drill, and rifle practice." After a discussion the tunic of the Royal Flying Corps was decided upon as being the most suitable uniform for their work.

**Contents of this Issue.**

Among the chief contents of this issue will be found a series of photographs in and around Verdun taken by a motor cyclist attached to the staff of the French Army (page 446), and an article on "The All-weather Motor Cycle" (pages 448-449), curiously enough by a Médecin Chef of the French Army, Dr. René Camus; another novel motor scooter (page 449); some specimens of water-cooled sparking plugs (page 450); some exclusive details of post-war programmes of different manufacturers (page 451); impressions by a Midland motor cyclist on despatch riding in German East Africa (page 452); an illustrated description of a new 5 h.p. flat twin Brough (pages 455 and 456); manufacturers' opinions of the new Order prohibiting the manufacture of new motor cycles (page 462); the Reading-Standard trade carrier page 461; items of interest from Overseas (page 462).

**A Simple Kick-starter.**

To convert the pedalling gear of a three-speed hub geared motor cycle to a kick-starter is a comparatively simple matter with Triumphs or other similar motor cycles. The sketch illustrates the manner clearly. Fix a chain to the chain wheel at A, and from B to C

The pedalling gear of a three-speed hub-gear motor cycle converted into a kick-starter.

fix a strong tension spring. On the other side of the motor cycle fit a longer crank case bolt, or stop, to catch the crank at correct position. The fixing can be adjusted to suit the required position of the k.s. crank by altering the left crank on the bracket spindle.

**Humber, Limited.**

The directors of Humber, Ltd., in presenting their report for the year ended 31st August, 1916, state that the accounts show a net profit on the year's trading of £51,293 13s., to which has to be added the sum of £48,659 brought forward. A 12% dividend is to be paid on the preference shares in discharge of two years arrears, £10,000 to be added to the building fund, and £50,174 carried forward.

**The National War Funds.**

For the week ending November 18th the principal war funds stood as follow:

The Prince of Wales's Fund	£5,977,580	0	0
(£5,474,475 distributed)			
British Red Cross Fund	5,257,754	13	6
The Queen's Fund	170,190	5	11
Tobacco Fund	119,258	0	0

**Definition of Motor Spirit.**

The question as to whether the use of paraffin and other substitutes is covered by the recent Order restricting the use of motor spirit is now definitely settled. The Home Secretary says the term "motor spirit" should be interpreted as being only such spirits as were liable to duty under the Finance Act.

**Pistons of Aluminium Alloy.**

Some doubts have been expressed in certain quarters regarding the suitability of aluminium alloy for the manufacture of motor cycle pistons, because motor cycle engines are for the most part air-cooled. In this connection it is interesting to note that in America an alloy, magnalite, has been adopted for use in a 35 h.p. air-cooled car. This fact should allay any doubts as to the possibility of aluminium alloy being used with success on a motor cycle.

**Flat Twins—Still They Come!**

Another flat twin—a type of engine with which *The Motor Cycle* has been so closely identified—is described and illustrated in this issue. The machine in question is a new Brough rated at 5 h.p., and of a design so clean that comment is at once evoked. It will be recalled that the Brough Company has already had several years' experience of horizontal twins, and the present model is the outcome of valuable data gained on road and track.

Mr. and Mrs. Coates, of Hendon, are enthusiastic users of the Royal Enfield. They have since 1913 covered well over 20,000 miles, including various competitions in which they were keenly interested, as well as tours in Scotland, Wales, the Lakes, and Devonshire.

## Connecting Rod and Piston Head in One Piece.

A VERY novel piston and connecting rod construction is described in *The Autocar* of last week, in which, to put the matter quite briefly, the piston head is replaced by a bulbous head attached to the connecting rod and surrounded by a sleeve which carries the piston rings and forms the piston skirt. Whether such a construction is likely to become common in motor cycle engines is a moot point, but the designs are certainly interesting and ingenious, while a reduction of weight is claimed. Another advantage is that the part of the bulbous head which comes into contact with the heat of the explosion does not become oily, and so accumulate carbonised oil.

The end of the connecting rod is spherical, or partly spherical, in shape, and the seating is ground to the same radius, and it will be interesting to observe whether or not this will remain gastight.

Several methods of attachment have been devised. In A and B the head is first slipped into position in the sleeve, turned through an angle of 90°, and secured to the connecting rod by means of a nut.

In the types C, D, and E the head is made in one piece with the con-

Designs of pistons and connecting rods, showing various methods of eliminating the gudgeon pins as suggested in the accompanying article.

necting rod, and held in position by the lower seating, which is, in turn, secured by a split ring. In D a strengthening web will be noticed, and also an alternative form of head which is suitable for two-stroke machines.

In the drawing marked F, in addition to a two-stroke head, as in D, there is shown an outer sleeve in two pieces, which are held together by a ring possessing two inwardly projecting flanges. In this case the big end must be passed through the lower flange before the engine is assembled.

In the case of G, the enlarged connecting rod end is attached to a perforated spherical head by a bolt, which has free play in the head, a perforated washer ground to the same radius as the outside of the head, and a nut. The A, B, and G types would have a distinct advantage in the case of an engine with a detachable head, which is that, on the nut being removed, the pistons can be slid bodily out of the engine for the examination or renewal of piston rings.

These pistons are the design of Messrs. T. J. Biggs, H. Henry, and H. W. Hindley, and open up quite new ideas in the matter of engine construction.

## The Magneto Position.

ONE of the burning questions of the day in the motor industry is that which concerns the production of magnetos in this country. For the past three years *The Motor Cycle* has urged manufacturers to create and develop the British production, but until comparatively recently the necessity was not realised, and although the position to-day is encouraging, the supply is not nearly equal to peace time demands. In *The Autocar* of November 25th will be found a leading article reviewing the position, and making suggestions which are of great interest to all concerned in the building up of national industries. The chief point unquestionably in the establishment of a magneto industry is the laying of sure foundations, and these things are, says the writer of the article, "Government protection after the war, and the confidence of British motorists." With regard to the first, it has been suggested that all British magnetos or other ignition apparatus, including parts, should be protected in the following manner:

1. (a) Countries now at war against us: total prohibition of imports for at least five years, after this period a minimum of 33⅓% import duty.

(b) All other countries a minimum of 33⅓% import duty for five years, and 20% minimum after five years.

2. All Government departments should purchase only British-made magnetos, or ignition apparatus, and specify them for all subsidised vehicles.

3. No undertaking should be allowed to manufacture magnetos or other ignition apparatus in this country if they are in any way controlled by capital obtained from enemy countries or subjects.

4. It should be insisted upon that all goods be plainly marked, on the article itself, in a position to be clearly visible, the name of the country of origin.

5. That all advertising relating to foreign-made goods should clearly state the country in which the goods referred to are manufactured.

The suggestions are quite practicable, and there is no doubt that unless something of the kind be done the newly created British industry will not survive.

### IMPORTANT NOTICE.

#### GOODS MADE IN GERMANY.

The proprietors of this journal, being fully in accord with the recommendations agreed upon at the Paris Economic Conference, give notice that they will not permit the advertisements of new goods manufactured in enemy countries to appear in this publication, either during or after the war.

ILIFFE & SONS LTD.

## The Reading-Standard Trade Carrier.

Channel Steel Frame, sprung front and rear, 12 h.p. Air-cooled Twin Engine.

A MOTOR cycle trade carrier very popular in the United States is the Reading-Standard. and a consignment of these has recently reached the Metropolis. The design is distinctly good, the vehicle being efficiently sprung, not only in front but at the back; also, the frame is not without interest, as it consists of a main channel steel frame, a single piece of steel suitably stayed by means of cross members, narrowed behind and widened in front. The back wheel is carried on an inner frame, which is hinged to the centre of and carried below the main frame. This inner frame supports the power unit and gear box, which is exactly the same as is fitted to the Reading-Standard motor bicycle. The two frames are connected at the rearmost end by means of full elliptical springs, thus completely insulating the driver from road shocks.

### Engine Details.

The Reading-Standard engine is a well-finished V type cycle motor having a bore and stroke of  $3\frac{1}{2}$  in.  $\times$   $3\frac{1}{2}$  in., and a cubical capacity of 68 cubic inches ( $85.7 \times 95.25$  mm., 1,100 c.c.), which is rated at 12 h.p. The valves are arranged side by side, while the carburetter is the well-known Schebler automatic. The lubrication is effected by means of a mechanical pump, which keeps a constant level of oil in the crank chamber from the oil reservoir in the cylindrical tank, which also carries a considerable supply of petrol.

The gear box is of the ordinary three-speed type and has a kick-starter incorporated with it. The control follows standard car practice throughout, the left pedal actuating the multiple-disc clutch, and the right pedal the external brake on the back hub. The change-speed lever working in a quadrant is fitted in the usual position, and there is also a side brake lever operating the internally expanding brake. The clutch, it may be mentioned, has an interlocking device, preventing the gear lever from being moved unless the clutch is withdrawn, which is common on American machines.

Chassis design, showing method of rear springing and general disposition of parts.

The transmission is by chain. Direct wheel steering is fitted. Altogether the Reading-Standard tradesman's tricar seems to be of a very practical design.

12 h.p. Reading-Standard twin-cylinder engine with cover removed, showing timing gear and pinion drive to magneto.

and should prove to be an economical vehicle for the purpose of delivering goods. It has been tested with a load

of 8 cwt., excluding the driver, and is supplied with various types of bodies. The London agents are the Reading-Standard Motor Cycle Co., 28, Baker Street, Portman Square, W.

### IMPROVED PILLION SEAT.

A RECENT improvement which has been made to the Tanpillion motor cycle seat, made by Messrs. Frank Ashby and Co., Princep Street, Birmingham, is an arrangement of the attachment clips, which allows the seat to be fitted to any size of carrier and to take pannier bags as well. The adjustability is provided by means of

The new Tanpillion seat.

Side view of the capacious van body of the Reading-Standard carrier.

slots, and the plates are enabled to slide one over the other to suit the distance between the side tubes of the carrier. The amount of adjustment is about 3 in.

Another recent addition to the Tanpillion seat is a backrest, which will be found a distinct advantage for long journeys. The seat can be supplied with or without the backrest.

### REPAIRING WATERPROOFS

IT is impossible to effect a neat and permanent repair of waterproof garments, but a few more weeks' wear can be procured by lightly drawing the edges of any gash together with needle and cotton, and then solutioning a canvas patch on the inside, after the manner of repairing a tyre. After such a repair, cut the stitches out, or they may catch on something and produce fresh tears.

## MANUFACTURE UNDER PERMIT.

Some Motor Cycle Manufacturers' Opinions and Experiences.

IT would appear, from information which has reached us since the Prohibition

Order of the Minister of Munitions was circulated, that all manufacturers are not being treated alike. We know of an instance where a firm received permission to go ahead with all the motor cycles lying about its works in an incomplete state, whereas another firm could not obtain such permission, and has been informed that there is little hope of receiving assent. In Birmingham a light car firm has received permission to proceed with work on hand, and a firm building sidecar bodies in Coventry has been told that the Order does not affect them, though we believe that 99% of people reading the Order would interpret it as covering bodies, which, after all, go to complete a new machine. Another firm of light car manufacturers which asked for permission to continue manufacture received

forms for filling-in purposes, but before they could have been received and considered by the authorities, the necessary permission came to hand.

### Tot Homines, Quot Sententiæ.

One Midland manufacturing concern has on hand scores of sets of parts of motor cycles, and could, if allowed, build up many complete motor cycles for Overseas markets independently of outside material. In such cases as this, it will be agreed that national interests would best be served by the manufacturers being allowed to assemble the machines and export them, particularly as there are only a few eligible men in the whole of the factory, these being necessary to superintend the operations of the ineligible.

A firm with whom we spoke has in stock sufficient material and parts for nearly a thousand machines. If permits

cannot be obtained to assemble and deliver these as required, stock will deteriorate, and may possibly be thrown on its hands.

Another trader's opinion was that Government should allow a period in which stock could be assembled and delivered, and then, unless on Government work, further production should cease. This trader was indignant that the Order was sprung on him, as it were, and that no previous official notification was given.

That the Order was quite correct, was the opinion of yet another manufacturer, and that it would bring all motor cycle manufacturers into line, whereas previously, while a controlled firm could not deliver any motor cycles at all, or only two or three here and there for private orders, others were assembling and sending out machines in fairly large quantities.

## OVERSEAS TRIALS.

A Splendid Performance of a Sidecar Combination under Appalling Weather Conditions.

ONE of the most strenuous reliability motor cycle tests of moderate duration yet held in Australia was arranged under the auspices of the Victorian M.C.C. on September 23rd. The course was from Melbourne to Marysville and back—a distance of 122 miles. It is a stiff test at any time, owing to the mountainous nature of the country. Rain had fallen for some forty hours previous to the time of starting (9 a.m.), and continued to fall throughout the day. The competitors knew that the travelling conditions would be strenuous, and only twenty-five of the forty-six entrants faced the starter, the larger number of the machines used being sidecar combinations; in fact, there were but four solo machines participating. That it proved a great struggle against the elements is shown by the fact that only four competitors completed the course, only one of whom finished the journey within the time schedule. This was J. H. Rhodes, who, with his wife in the sidecar of a 7 h.p. Indian combination, covered the 122 miles of heavy flooded roads in 5h. 46m., exclusive of one hour spent in having lunch at Marysville.

In the circumstances, it stands out as a most meritorious performance. There were two classes of competitors—sidecar and solo machines—each of which was again divided according to engine power, high and low, but none whatever in the latter category finished. Those who completed the course are as follow:

	Time.
1. Mr. and Mrs. J. H. Rhodes (7 Indian sc.)	5h. 46m.
2. H. A. Parsons and Miss M. Garland (7 Harley-Davidson sc.)	6h. 30m.
3. H. Pannach and E. J. Jackson (7 Excelsior sc.)	7h. 3m.
4. N. Galsworthy (7 Indian solo)	6h. 59m.

### Appalling Conditions.

Reports of the appalling condition of the roads came to hand from contestants who were forced to return. In Watson's Creek Valley (Christmas Hills) a culvert was washed away, necessitating a detour, but several plunged into the water unaware. It was after passing Yarra Glen that trouble and danger confronted the riders. Along the flats north of the line the water was steadily rising. Some who passed over in the morning could not force a passage back after lunch, the water in places being 2ft. deep, while

the road was submerged in many instances for half a mile in length. Here and there a neck of land or an isthmus, sometimes an islet, showed the course of the highway. Many of the competitors ran off the road proper, and had to jump into the water knee deep to aid the engine to pull through the mud. One rider, in curving too sharply on the Blacks' Spur, turned a somersault; another, by some means, lost his sidecar, which broke away, and was last seen rocking like a cockee boat in the mountain torrent.

One of the chief causes of delay was through water reaching the magneto, when several of the instruments had to be dismantled and dried. With such heavy going there was much low gear work, and oiling freely for safety caused fouling of plugs. But worse was the ingress of water into the crank chamber, one rider having to stop and drain the case twice—a most unusual proceeding. Tyre troubles fell to some, and changing tubes or covers was dirty work. It is significant that *no machines having belt drive came through*, while those which finished had change-speed gears in addition to chain transmission.

### The Johannesburg-Durban Record.

Six days later this was again reduced by the Enfield to 15h. 51m., and the Indian, as reported in our issue of November 16th, replied with 14h. 50m. On October 13th the Enfield knocked another thirty-eight minutes off the previous best, and so at present the record stands in favour of a British machine at the excellent figures of 14h. 12m. (29.6 m.p.h.).

### The Solo Record.

While the sidecar record-breaking attempts were in progress Messrs. Shimwell also took the solo record in hand, sending P. Flook (Triumph) and G. Usher (B.S.A.)

over the route. The former met with bad luck, but the latter finished the journey in 15h. 39m. On the occasion of the last Enfield success Flook made another attempt, and accomplished the extraordinary time of 12h. 33m. In 1914, under more favourable conditions and a slightly shorter course (415 miles, against 421 as at present), Adams (Rudge) accomplished the trip in 11h. 30m. (average 36.09 m.p.h.), while in the previous year McKeag (Bradbury) finished in 14h. 46m. Flook's average on a three-speed Triumph was over 33.5 m.p.h. We understand that Dunlop tyres were used throughout.

### The Sidecar Record.

This record is attracting a considerable amount of interest and enthusiasm in South Africa at the present time. The sidecar record was begun by Messrs. Williams, Hunt and Co. taking a passenger to Durban in 18h. 29m.—twenty-three hours being the time taken by the mail train. This was in September, 1915. A year later Messrs. Shimwell Bros., feeling confident that this could be beaten by an English machine, sent an Enfield over the route in 18h. 24m. At the third attempt Owen and Rosenthal, on an Indian, regained the record (16h. 43m.).

The Editor does not hold himself responsible for the opinions of his correspondents.

All letters should be addressed to the Editor, "The Motor Cycle," Heriford Street, Coventry, and must be accompanied by the writer's name and address.

### The Flat Twin at the Bar.

Sir,—I should like to confirm all that "Ixion" states. Firstly, as to limits of size. There are a large number of F.T. engines developing 25 e.h.p. at 550 revs., water-cooled, running on paraffin, and used in this country on agricultural tractors.

In *Internal Combustion Engineering*, Vol. III., page 364, there is illustrated and described a F.T. engine having a bore of 3½ in., and a stroke of 3½ in. = 904 c.c., built by Messrs. Dixon Bros. and Hutchinson for wireless telegraphy. The Ivel Co., of Biggleswade, has made a large number of F.T. engines of 6½ in. bore × 6 in. stroke = 5,312 c.c., also for agricultural tractors, and running on paraffin.

I am at present designing a F.T. engine of 7 in. bore × 8 in. stroke, to develop 30 h.p. at 550 revs., on paraffin, water-cooled, capacity in cubic inches = 615.74 = 10,089 c.c., which will be used on agricultural tractors after the war.

I have compiled a list of over thirty F.T. engines of American make, varying from 4 in. bore × 5 in. stroke, to 8 in. bore × 10 in. stroke, particulars of which I would be pleased to send you for publication if desired. VULCAN.

Gainsborough (Lincs.).

### Overheated Sparking Plugs.

Sir,—Having been particularly interested in the controversy on sparking plugs, recently appearing in the columns of your ever welcome journal, I thought perhaps my experiences might be of interest.

Out here one gets a variety of plugs through one's hands, and it is regrettable to say that the majority are far from satisfactory. Broken porcelains, loose mica packings, and overheating are quite common occurrences, and these are all to be met with on first-class British plugs. In the early part of 1913 I happened to come across a couple of Mascot single point plugs, marketed by Messrs. Blumel, of Wolston, the electrode being about ⅜ in. diameter.

After having done numerous laps at Brooklands in a Singer car, they gave perfect satisfaction both during practice and in the T.T. of that year, and later in the Grand Prix run at Amiens. In the whole of my experience they have been the only plugs to compare favourably with the German article with which the British market was flooded in pre-war days. I doubt if this particular type of plug is now obtainable, however.

It is a well-known fact that the later edition of the single point Bosch was by no means the success of its prototype.

In closing, I must add the usual disclaimer.

B.E.F. F. G. BALL (L.-Crl.), A.S.C., M.T.

Sir,—In reply to Mr. Cosh's letter I would strongly recommend him to try Lodge racing plugs air-cooled.

I ride a lightweight Villiers two-stroke engine, and was troubled for a considerable time by the mysterious stoppages such as several of your correspondents appear to have experienced. The garage here attributed it to overheating, due to my hardly being in the lightweight class, but as there were no signs of seizure this explanation did not satisfy me.

My last plug was a Lodge two-stroke, but it was as bad as the rest. It had a waterproof terminal, which I cannot think a good thing for a hot engine, as it is bound to hinder radiation from the central electrode.

To assist the cooling of the plug, I made a radiator out of a strip of aluminium, with a hole in the centre the size of the screw on the plug, and it is slipped over the thread before the washer. The ends are bent back at about 45°, and punched all over to increase the cooling surface. The

results have certainly so far been most satisfactory, and I wonder why this fitting has not been put on the market.

In turn I would like to put two queries—

1. Why does no maker turn out a model ready fitted for using substitute fuels, with a compartment in the tank for petrol, and some system of warming the intake? and

2. Why do makers of two stroke engines class a 226 c.c. as 2½ h.p. and a 349 as 2¾ h.p.? The powers are as 9 to 11, and the volumes as 11 to 17, or as 4½ to 3½ h.p.

Dunbar.

F.R.N.C. (CAPT.)

### Electric Lighting for Motor Cycles.

Sir,—I have been very much interested in Mr. Hursley's experience with electric lighting from a dry battery, but do not see why one should use batteries when the magneto will do the work well. The light obtained is quite a revelation, and has to be screened in order not to be caught by the "special." As the light required while stopping is only of short duration, the battery or accumulator need not be a bulky one, and the one fitted by the makers lasts quite a long time.

I fitted the F.R.S. set about a year ago, and used it for about 4,000 miles. My mount has a Dixie magneto. I also have had another set fitted to a Douglas, using it as well for head and tail illumination, and this has now run for some 2,500 miles without the slightest trouble. The magneto in this case is a Bosch.

My first set included F.R.S. lamps, but for the Douglas set I converted acetylene lamps into electric by fitting F.R.S. adapters. The whole lighting set is a nice arrangement, consisting of a box about 4 in. × 3 in. × 3 in. in size, and having everything inside. It clips to the top tube, and requires no other fitting or wiring up. Three wires protrude, one for the head lamp, one for the tail, and one for the magneto. The switch is on the near side of the driver and watertight.

I hold no brief for the F.R.S. Co., but simply state my experience as a satisfied rider. F.I.H.

Edgbaston.

### Will the Single-cylinder Survive?

Sir,—I have been tempted to write you for the first time since 1912, when I first read your paper. By the correspondence which has been raging in your pages anent the eternal question, is the even torque of the twin to be preferred to the greater reliability and economy of the single? this, to my mind, is entirely a matter of choice. Many prefer the feeling of sitting above a single with a bit of a tug to sitting above a twin revving at rather a high speed. Happily, however, there are some points which all motor cyclists are agreed upon. Chief among these points is the fact that the motor cycle is no better cooled than its ancestor of 1906-7, and is a great deal less economical. As far as cooling goes, the A.B.C. is a step in the right direction, but it would be interesting to know why Mr. Bradshaw chose cast iron for his cylinder head in preference to aluminium, why he did not make his heads detachable, and why copper rings shrunk on to a plain steel cylinder were passed over when he was arranging his cooling. Another point: why should it not be possible to build a motor cycle with only three or, at the most, four sizes of nuts on it? My machine is a 5-6 h.p. twin of first-class make, about which "Ixion" once waxed very eloquent. If it has one size of nut it has ten, and similar variety of threads.

W. B. TOBEY.

### American Machines.

Sir,—Seeing remarks in your paper on American "crudities," by Capt. Lindsay and others, I would like you to publish my experience as a novice with one of the culprits. My machine, a Harley 7-9 h.p., was new on July 16th, 1915, and I have driven it over 6,000 miles with Millford tandem sidecar attached. It has cost me nothing in repairs or renewals, not wanting any, and had no adjustments except for tightening the chains and clutch. The clutch has had very hard usage, and shows no sign of wear. On a journey to Blackpool and back (about 245 miles) with a load of 33 stone I never needed bottom gear, and consumed three and a half gallons of petrol (70 m.p.g.), which is my average consumption. The machine runs as well now as when new, and has never let me down, and I have yet to find in my ordinary course of travelling the hill which the "silent grey" will not "romp up." If any of your correspondents come my way I shall be pleased to take them for a short run. Usual disclaimer.

Mansfield.

HARLEY.

### Bearing Pressures.

Sir,—I have read the article on "Pressure Bearing," by "A.A.S." in *The Motor Cycle* of October 19th, and am really afraid lest the ordinary reader will be misled, and think the long stroke engine a bugbear upon the road. Really the article ought to have been headed "The Advantage of the Medium Stroke Engine over the Long Stroke Engine." While "A.A.S." has tried to overthrow the long stroke engine, I am pleased to think in reality he has only helped it on. But "A.A.S." ought to know that the long stroke engine was designed and not thrown together without thought.

In the first place, why use a larger crank pin? Is not one with a  $\frac{3}{4}$  in. diameter bearing large enough? Of course, a larger crank pin can be used in the long stroke, if desirable, just as in the medium stroke, by allowing for an arc recess in the flywheel rim, assuming the rim to be  $1\frac{1}{2}$  in. in width.

Then again, the small end bush of the long stroke engine is  $1\frac{1}{2}$  in. in width. Surely this is wide enough for a bearing of  $\frac{3}{4}$  in. diameter; but, if one needed a wider bearing, 3 mm. could easily be machined off the bosses inside the piston.

Furthermore, with regard to cylinder lubrication. If "A.A.S." will spin the flywheels of his long stroke round (with cylinder off) he will find the oil rise  $1\frac{1}{2}$  in. above the crank case. This means that when the cylinder is on the throw of oil is 2 in. up the cylinder wall; also there are four oil grooves in the skirt of the piston and four  $\frac{3}{4}$  in. holes in the waist of the piston, thus carrying the oil to the piston rings, therefore the cylinder gets ample oil, for there is always a certain amount of oil in the waist of the piston, and always a fresh supply being thrown up by the connecting rod and wheels. If however, as "A.A.S." assumes, the long stroke engine is starved of oil, will he tell me how it is one finds the cylinder and piston top carbonised?

We will suppose the gudgeon pin of the long stroke engine travels  $\frac{3}{4}$  in. in its bearing, and the gudgeon pin of the medium stroke engine travels  $\frac{1}{2}$  in. in its bearing. The medium stroke engine will wear oval quicker, and will produce a knock sooner because it has less bearing surface.

I think "A.A.S." makes a mistake in saying the cylinder wear will be greater on the long stroke because of the connecting rod swinging at a greater angle. Will "A.A.S." prove to me that a cylinder wears oval on its greater bearing surface, i.e., rear and front cylinder walls, as he assumes? Piston and cylinder wear are relatively of little value, and when wear does take place it is caused not so much by the piston, but by the piston rings. This can best be proved by a long or short stroke engine cylinder wearing large at the top and by the fact that in the horizontal gas engine, which has the weight of its piston to carry, after many years' hard wear the liners (cylinders) will be found to be very little out of rotundity. The only stroke the piston gives any real wear to the cylinder is the firing stroke, when the piston is tilted, and receives its greatest pressure from the explosion.

CYRIL J. NORTH.

Sir,—The reply of "A.A.S." to my letter leaves me still unconvinced, and I still regard his article as lacking in the fairness which an unbiased investigator should display. May I, therefore, ask for space for a short answer to his letter?

BR8

(1.) I may leave this point to makers, but still do not agree with "A.A.S."

(2.) I have shown "A.A.S." to be wrong here, and he does not contradict my figures; but now that the point in question works out the other way he says that "The slightly greater speed makes little difference. In his article he said: "The long stroke engine suffers wear for a greater distance of its bearing travel." In this case greater speed involves greater distance. How can these two statements be reconciled? "A.A.S." cannot have it both ways. Further, he tries to place upon me the onus of having said, or argued, that the smaller the bearings the better. This I did not say; but still, so far as friction alone is concerned, provided that the bearings are of sufficient area to retain the requisite film of oil, it is true.

(3.) I agree that on a motor cycle a connecting rod as long as would otherwise be desirable is not a practical proposition.

(4.) There was no fallacy in my statement. I am, of course, aware that a long lever and light weight can be balanced by a short lever and a heavy weight, provided that the weight be heavy enough, which is not so in this case. In the two engines compared the advantage is about 12 to 11 in favour of the long stroke, and the gear can therefore be higher by that amount. In consequence P (for the long stroke engine) will equal 31.6 lb. instead of 38 lb. (page 335).

(5.) In his article (page 335) "A.A.S." says, "It is important to note the  $v^2$  factor in the given formula, as this, combined with the lesser radius (the italics are mine), will always render the short stroke engine the smoother running of the two when the other conditions are equal." Other conditions naturally include  $v^2$ , and whether "A.A.S." does or does not suggest what I stated in my last letter (November 9th) I will leave your readers to decide. All whom I have asked agree that he does. I have taken "A.A.S.'s" advice to read the end of his article carefully, and, in consequence, I am impelled to ask him a simple question. Did he, or did he not, at the time he wrote his article hold the opinion that the smaller radius, *per se*, meant that the pressure of the unbalanced force would also be smaller? If he did not, then his use of the English language is unfortunate; if he did, he was wrong.

JOHN BONYTHON.

### A Suggested Vaporiser.

Sir,—I enclose a sketch of an appliance for a motor cycle carburetter, enabling the rider to start up at any time and run on paraffin or some other heavy petrol substitute. It merely consists of a cylindrical-shaped water jacket which

A remarkable idea for a vaporiser suggested in a letter by C. L. Whatley.

is slid on to the induction pipe, forming a vaporiser. A thickish pipe is taken from the water jacket, coiled once or twice round the exhaust pipe, and returned to the jacket. A small oil or spirit lamp is placed well out of the way of "dripping" fuel under the jacket. This is lighted, and in a very few minutes a start from cold can be made with heavy fuel (this is, of course, done more quickly if the cold water contained in the jacket is drained out through the tap and hot water injected). Just before or after the start the lamp is extinguished, and as soon as the engine has started the exhaust pipe becomes hot, and therefore keeps the whole vaporiser at a very high temperature as long as the engine is in motion. A hot air intake from the exhaust, by means of a flexible tube, might also be added.

C. L. WHATLEY.

[We should like to ask our correspondent whether he has tried this device, and what causes the water to circulate and maintain its heat.—En.]

**Steatite Insulators.**

Sir,—We trust we may be permitted to comment upon "Ixion's" note on page 379 of your issue of the 2nd inst. regarding steatite insulators. In the first place, and as the original British makers of fused steatite plug insulators, we must take exception to your contributor's sweeping statement that ordinary steatite plugs, *e.g.*, steatite plugs other than certain German ones, "droop like a lily, and hang down like stalactites after two minutes' running." This is a very grave reflection on British makers and calls for explanation.

In the first place, the mineral steatite is commercially infusible when pure. Certain other minerals, such as potash, soda, felspar, etc., have the property of acting as fluxes at various temperatures, and are, in consequence, employed by potters in this connection to reduce the non-melting or refractory elements such as steatite or flint in the production of what is known as the "body." It will be obvious that if a violent excess of flux is employed a body can be made incorporating a proportion of steatite which will, nevertheless, fuse at a low temperature; while, on the other hand, the proper proportion of the correct flux will result, when combined with the purest quality of steatite, in the production of a body which will not fuse or become crystalline except under most terrific heat. The word "steatite," therefore, is open to abuse, as a material may be made to incorporate much or little of this substance, the virtue of which may in a large measure be lost by being mixed with other ingredients.

Quite recently we examined a steatite insulator upon a plug of well-known English make, and found it to be largely composed of powdered firebrick (which assists to stiffen the more fusible elements) plus a certain quantity of steatite and a large addition of material fusible at a low temperature. Even this did not "droop like a lily" until it attained a heat too brilliant for the naked eye to endure, and far exceeding a heat sufficient to cause auto-ignition. Given sufficient heat all insulators—German steatite or otherwise—will droop like a pat of melted butter.

Unfortunately for themselves, other plug makers have not, so far as we are aware, any knowledge of the composition of their steatite insulators, and, in consequence, are unable to control it; but a more important point is that any insulator or exposed portion of the plug which attains anything more than a dull red heat will cause auto-ignition. From this it may be assumed that the fault in your contributor's case almost certainly lay in the unsuitable *design* of his plugs, the insulators of which did not carry off the heat with sufficient rapidity. Under these circumstances the fitting in question would continue to accumulate heat until it approached the heat of the exploding charge, at which point, or thereabout, any insulator, English or German, steatite or mica, would melt and be worthless.

English steatite plugs of reasonable price are now made, which not only do as well as but will give far better service than any German plug ever produced, but the need of these super-plugs for war purposes is so great that they cannot yet be offered to the private motoring public. Hence this letter.

THE SPHINX MANUFACTURING CO.

**Floatless Carburettors.**

Sir,—With reference to the description of a floatless carburettor in your issue of October 19th, of which Mr. Barry claims to be the inventor, I beg to inform you that this type of carburettor has been used for some few years, with considerable success, by the New Pelapone Engine Co., Leeds, on their high-speed stationary engines, using coal gas as fuel.

I may say that this firm, realising long ago that paraffin could be used as a very economical and efficient fuel for high-speed engines, has been using for some years a paraffin carburettor of its own design, which has always given perfect results. I think paraffin as a fuel for motors has come to stay.

Lee, S.E.

H.H.L., M.T., A.S.C.

**"Somewhere on the Desert in Egypt."**

Sir,—A copy of *The Motor Cycle* of September 21st has just arrived, and I note with more particular interest the remarks of the four R.F.C. D.R.'s. I, as an R.E. D.R., would like to criticise their remarks *re* the possible mileage of man and machine. There is one case in particular I should like to draw your attention to, and that is of a Triumph motor cycle minus wheels mounted on a light narrow gauge railway truck, and driving it with a gear ratio of  $8\frac{1}{2}$  to 1 a distance of fifty-four miles per day for approximately six months. The weight of this vehicle is about  $2\frac{1}{2}$  cwt., irrespective of driver, mails, or passenger. This engine up to date has covered at least 9,000 miles, and never been overhauled. To quote the R.F.C. D.R.'s own words, considering the quality of the "juice," the climatic conditions (sometimes  $120^{\circ}$  in the shade), and, worst of all, the foreign matter, such as sand particles, etc., getting into the engine, and also taking into consideration the gear ratio of this vehicle in comparison with the average single-cylinder military motor cycle, I think this engine is not far off the record.

I have been a despatch rider since 1914.

Egypt. (CPL.) G. AYLETT, R.E.

**Petrol Distribution.**

Sir,—I suppose motor cycling in the old country is nearly dead, as you have only been allowed two gallons a month.

This is all right for the babies, but the big twins cannot get far. Motoring here is in full swing, and the labourers can afford Fords (no pun); a four-seater costs £70. A powerful twin with sidecar can be got for £57. The twins are very popular here. Petrol is now twenty-three cents (11½d.) a gallon; it was twelve cents last year!

The petrol distribution is very efficient here. I enclose a photograph of an automatic measuring pump supplied from a tank underground. These tanks are in all small and large towns wherever there is a garage. Air pumps are also fitted in garages for blowing up the tyres, worked by motor engine. Complaints have, however, been made that they give short measure, but the Government are making investigations. The main roads here are very fine, all asphalted, with dirt side tracks for wheeled horse vehicles, but the side roads—unmentionable. I have not seen or heard of any police traps in the country, but they are strict in New York City, and "speeders" have paid pretty heavily lately. There is no tax on motor cycles, only the registration fee, and cars pay five dollars a year driving licence. I have not seen many motor cycles here. The fact that cars are so cheap is probably the reason. The native loves comfort, and is not, in my opinion, such a sport as a Briton.

JOHN W. CUFLEY.  
New Jersey, U.S.A.

Mr J. W. Cufley,  
late R.N.A.S.

## PATENTS.

Abridged by ERIC W. WALFORD.

### A Spare Tube Carrier.

The device illustrated carries two tubes, which are coiled up round a sleeve A, which is slipped upon a stem B attached by a clip at C to any suitable part of the machine. The coiled-up tubes are encased by a box which is divided into two parts

D and E, and through the holes F the valves project. The outer or right-hand box is held in place by the wing nut G, and after this is screwed up the two coiled-up tubes are inflated from outside, so that they pack tightly against the interior of the box and cannot chafe.—F. Lane and P. L. Cearns, No. 13,633, 1915.

### Fork Construction.

Steering forks are usually constructed of four separate parts brazed together, i.e., the steering column, fork crown, and two fork sides. The invention illustrated provides a simplified construction, the fork consisting of two parts only. These comprise a pair of tubes of half-round section, the lower end of each of which forms one fork side, whilst at the position which would normally be occupied by the fork crown the forks converge, and finally meet, and are secured together to form a circular steering column.—Soc. Anon des Automobiles et Cycles Peugeot, No. 9,641, 1915.

### A Cooling System.

This invention is shown as applied to an engine having opposed cylinders, and it comprises a rotating fan, which is apparently constructed in one with the flywheel. This fan directs a blast inwards, which is diverted towards the cylinder heads by means of the baffles shown. The cylinders are enclosed in

cylinders, and the air travels through passages into the cowls at a point near the cylinder heads, and then down the

cylinders, finally escaping just below the lowest radiating fin.—C. A. Hult and O. W. Hult, No. 14,271, 1915.

### A Shock Absorber.

Where two parts are required to be connected together resiliently, say, for example, the springs and shackles of a sidecar, the mechanism illustrated may be used. This comprises a washer having an upwardly extending loop, which is suspended by a pivot pin from one of the parts to be connected. The other part pivotally carries a pair of side plates, which extend upwards to near the top of the loop, and are then turned over to form flanges, between which and the lower washer is arranged a spring. It will be seen that relative movement of the two parts can only be effected against the pressure of the spring.—J. P. Maclean, No. 100,860.

### Valve Mechanism.

The illustrations here given are a side elevation and a sectional plan of an engine, in which the ordinary type of valve mechanism is discarded in favour of oscillating plates; which open and close ports in the cylinder at the required times. The ports

are shown as being arranged on opposite sides of the cylinder, and the valve plates are carried upon arms which are pivoted out of centre in order that a large and quick movement may be imparted to the valve plates for a small movement of the lower ends of the arms, giving the effect of quick opening and closing of the ports. Movement of the lower end of the pivoted arms may be effected by cam mechanism, but in the construction shown solenoids or electric coils are used. These are alternately energised by a current controlled by timing mechanism, which is not illustrated in the drawings of the patent specification. Between the coils is a wire core, and as each coil in turn is energised the core is attracted and moves over to that coil. Attached to the core is a block, with projections which engage the lower end of the valve arm, so that, as the core moves, this arm is oscillated, thus opening and closing the port. The valve plates are enclosed by detachable covers, which carry the spigots for the carburettor and exhaust pipe.—J. T. Scarborough, No. 14,241, 1915.

## SPARKLETS.

### Flash Lamp Batteries.

We are in receipt of an interesting little booklet by E. Gordon, and published by Messrs. Gordon's Electrical Depot, Royston, Herts, price 6d. This bears the title "Flash Lamp Batteries, their Construction, and how to Re-charge."

### Chemico Body Shield Addition.

Our military readers will no doubt be interested to hear that the Chemico body shield, which we described in our issue of May 11th, has since been improved by the addition of an attachment for protecting the abdomen; this attachment costs 10s. 6d. extra. We are told that there are more than 3,000 of these Chemico body shields in actual use at the Front. Practical demonstrations have shown these shields to be of very great value in warding off shrapnel or revolver bullets and bayonet thrusts.

### Future Radco Models.

Owing to pressure of important munition work, E. C. Radnall and Co., makers of the Radco, do not anticipate making any alterations to their existing two-stroke models. They have in view a new design for after the war. The Radco two-stroke model has been remarkably successful, and it is a boast of its makers that on no occasion has any purchaser been kept waiting more than ten to fourteen days for delivery in pre-war times, when they were in a position to execute their orders.

### Extension of Premises.

A few days ago we were shown over the new extension of Messrs. J. B. Brooks and Co., Ltd. No one would imagine from an exterior view that such a substantial new building had been erected behind the walls of the huge factory in Great Charles Street, Birmingham. Such is the case, however, and now the executive staff finds itself in smart new quarters, and behind these are new departments of the manufacturing premises built on the gallery system. Crafts requiring only light work occupy the galleries, and the basements are given over to heavier operations.

### Catalogues Reviewed.

Messrs. C. A. Vandervell and Co., who are pioneers of electric lighting for motor vehicles, have lately published a leaflet entitled, "C.A.V. Electric Lighting for Motor Cycles and Sidecars." At the present time they are devoting attention to battery sets primarily intended for use on sidecar machines. The batteries are sold in neat polished wooden boxes supplied with nickel handles and external terminals. The lamps supplied are of the finest quality and are most efficient. These include two patterns of head lamps and special brackets, sidecar lamps of the round and also the torpedo pattern; a sidecar dash lamp, and a switchboard controlling the head lamp, side lamp, and tail lamp. They also sell a special round tail lamp of neat design and an electric horn.

# C.A.V. Magnetos

BRITISH THROUGHOUT

Since the outbreak of war this magneto has played an active part on all fronts—by far the greater number of machines in use by our Despatch riders are C.A.V. equipped.

# MISCELLANEOUS ADVERTISEMENTS.

## PRICES.

**ADVERTISEMENTS** in these columns—First 12 words or less 1/6, and 3d. for every two words after. Each paragraph is charged separately. Name and address must be counted. Series discounts and special terms to regular trade advertisers will be quoted on application.

Postal Orders sent in payment for advertisements should be made payable to **ILIFFE & SONS Ltd.**, and crossed **& Co.**

All advertisements in this section should be accompanied with remittance, and be addressed to the offices of "The Motor Cycle," Hertford Street, Coventry. To ensure insertion letters should be posted in time to reach the offices of "The Motor Cycle," Coventry, or London (20, Tudor St., E.C.), by the first post on Friday morning previous to the day of issue.

All letters relating to advertisements should quote the number which is printed at the end of each advertisement, and the date of the issue in which it appeared.

The proprietors are not responsible for clerical or printers' errors, although every care is taken to avoid mistakes.

## NUMBERED ADDRESSES.

For the convenience of advertisers, letters may be addressed to numbers at "The Motor Cycle" Office. When this is desired, the sum of 6d. to defray the cost of registration and to cover postage on replies must be added to the advertisement charge. Only the number will appear in the advertisement. All replies should be addressed, "No. 000; c/o 'The Motor Cycle,' 20, Tudor Street, E.C."

## DEPOSIT SYSTEM.

Persons who hesitate to send money to unknown persons may deal in perfect safety by availing themselves of our Deposit System. If the money be deposited with "The Motor Cycle," both parties are advised of this receipt.

The time allowed for a decision after receipt of the goods is three days, and if a sale is effected we remit the amount to the seller, but it not we return the amount to the depositor, and each party to the transaction pays carriage one way. For all transactions exceeding £10 in value, a deposit fee of 2s. 6d. is charged, when under £10 the fee is 1s. All deposit matters are dealt with at Coventry, and cheques and money orders should be made payable to Iliffe & Sons Limited.

The letter "D" at the end of an advertisement is an indication that the advertiser is willing to avail himself of the Deposit System. Other advertisers may be equally desirous, but have not advised us to that effect.

## SPECIAL NOTE.

Readers who reply to advertisements and receive no answer to their enquiries are requested to regard the silence as an indication that the goods advertised have already been disposed of. Advertisers often receive so many enquiries that it is quite impossible to reply to each one by post.

## MOTOR CYCLES FOR SALE.

## DEFENCE OF THE REALM ACT

Under the provisions of the above Act, advertisers requiring workmen, and whose business consists wholly or mainly of engineering or the productions of munitions of war, or substances required for the production thereof, and whose works are situated within 30 miles of London, must include in every such advertisement the words, "No person resident more than 10 miles away, or already engaged on Government work, will be engaged."

Advertisers whose works are situated more than 30 miles from London can only have their announcements inserted with the approval of the Board of Trade, who will allocate to each advertisement a box number, and collect and distribute to the advertiser all replies received. The necessary forms of application can be obtained from any Labour Exchange or from the offices of this paper, and each advertisement must contain a clear reference to the effect that no person already engaged on Government work need apply.

## Future Design of Motor Cycles.

**M**ANUFACTURERS are to a large extent placed in a quandary in the consideration of after-war programmes, and we are frequently asked our opinion of the future type of motor cycle. So many excellent and promising designs already exist, it would be a bold man indeed who would lay down at this moment what he considers to be the ultimate design, as problems of this sort are governed so much by outside influences. We shall be voicing no new opinion in these columns when we state that the multi-cylinder engine is, to our mind, the engine of the future, and will eventually predominate, and our impressions at this juncture are that the passenger machine of the future, be it sidecar or sociable, will have a four-cylinder engine, while in the solo class there will be a strong leaning towards the flat twin.

We would not, however, like it to be supposed that, in laying down these views, we regard the single-cylinder as doomed, as a popular writer has suggested in these columns. At the time we published that article we gave it as our opinion that a single-cylinder machine, uncomfortable though it might be compared to a modern twin, would, from a utilitarian standpoint, always claim its adherents. However great a factor in a buyer's choice the question of comfort may be, the reliability point of view must always prove outstanding.

Again, the single-cylinder engine which, as a leading engineer has put it, is the most mechanically and thermally efficient type of engine, must be more economical in running costs—an important consideration in any after-war plans. Another influence directly affecting this question of the future type of engine is the fact that a single-cylinder engine is a much more simple manufacturing proposition, and this being so must prove immensely attractive to a manufacturer desirous of simplifying the works process and producing his motor cycles in

quantities. With proper organisation, large outputs, of course, mean that the selling price may be low; so that, judged from every standpoint, the much maligned single-cylinder engine has its attractions. We have pointed out in these columns on divers occasions that many a forecast of expert trade men has been dashed to the ground, as many such have failed to realise the basic fact that no one type of machine can ever satisfy the majority. It is good from many points of view that motor cyclists' requirements and ideals differ as they do, otherwise we should have stagnation of design, and motor cycling on a specialised mount would be robbed of half its interest.

## Refusal to Grant Driving Licence.

**A**CASE was brought to our notice the other day of a motor cyclist who, being unfortunate enough to be afflicted by deafness, was refused a driving licence by a certain County Council on the ground that he was physically incapable of holding a licence. Now it has been proved over and over again that a deaf motorist is not a danger on our roads—in fact, many expert motorists of to-day are deaf. The licence was refused to the reader in question, despite the fact that he made several demands. He finally wrote to us, and we recommended him to become a member of the Auto Cycle Union and get its legal department to take up the case, which he promptly did and placed the matter before the secretary. The secretary subsequently wrote a strong letter to the clerk of the said County Council, pointing out that, unless the licence were granted forthwith, the A.C.U. would be compelled to issue a *mandamus* from the High Court compelling one to be made out in the applicant's favour. The result was that the licence was promptly granted. It is on record that in the year 1903 a licence was granted to a man who was blind, so that no physical defect, under the present regulations, debars a man from holding a licence to drive a motor vehicle.

# DESPATCH · RIDING · IN · EGYPT

"I HAVE been in khaki since August 4th, 1914, and during that time I have ridden Indian, Rudge, Premier, Douglas, V.S., B.S.A., and Triumph motor cycles, but all my riding since March, 1915, has been done on a 1915 War Office model Triumph, of the behaviour of which I cannot speak too highly." So begins Cpl. A. C. Webb in a most interesting letter written from Egypt, where he is at present serving as a D.R. attached to a signal company with a regiment of Hussars. He continues: "From August, 1914, to April, 1915, I was busy riding hard in all sorts of weather conditions in England, chiefly in the South, Midlands, and the Eastern Counties. These points I will not dwell on, as the conditions are familiar to us all. Early in March, 1915, I was issued a new Triumph, and a few weeks later I was naving my ribs shaken together on the pavé around the docks district at Alexandria. I shall never forget that first ride on pavé. From April to September, 1915, I had many varied experiences.

## Main Roads and Dirt Tracks.

"Riding conditions vary considerably out here. We have first-class roads—the like of which I have never ridden over in England—but they finish very abruptly: that is, in the big towns in Egypt, of which there are about four, the local authorities take their roads just to the edge of the town, and there they

Cpl. A. C. Webb on his Triumph near the Sphinx, with the Pyramid of Cheops in the background.

finish. Sometimes one can run on to a 'dirt track,' otherwise called the 'main road,' in the cultivated areas, and sometimes one runs on to the desert. This depends, of course, on the direction which one is taking. There are no roads across the desert, excepting those which have just been completed for military purposes. One just tries to pick out a camel track if such a track is distinguishable. The roads in the cultivated areas are made on the banks of the canals and irrigation channels which intersect the country, and are chiefly made up of 'Nile mud.' Woe betide any unsuspecting D.R. who strikes a freshly watered patch of road at speed. He invariably finishes up in the canal, or, if he is lucky, on the edge of the bank. The variety of work we get is considerable, and we find that the mix up in languages is very funny at times; in

fact, it is most exasperating. One thinks in English, asks a question in Arabic, and receives an answer in Italian, which is not at all satisfactory to the unfortunate D.R. who is trying hard to get rid of his message.

## Two Long Journeys.

"My two longest rides have been from C—— to A—— and back (140 miles each way), and from C—— to P.T.—— and back (96 miles each way). This latter ride was the most strenuous and difficult of the two, as my route lay in a direct line east of C—— across the desert. Oh, the monotony of it all. Nothing but sand, sand, sand. What a contrast to the wooded lanes of Warwickshire! In places the desert is quite hard and fit for riding on, whilst in other places the sand is very deep, and the crank case is well in it. In such places one has to walk alongside, with the engine running in bottom gear, until one comes again to a hard patch. Overheating has never shown itself, even though the mercury has recorded a shade temperature of 119° at times. In the hot season here, particularly during these last two summers, a shade temperature of 112° has been very common.

"I am one of the much maligned Yeomanry motor cyclists. I still ride a motor cycle, and have done so without any break since August, 1914. We are all attached and under the control of the Signal Service, and so far the authorities in control have expressed themselves as completely satisfied."

Despatch riders posing in a manner which, as will have been gathered from recent illustrations, is becoming very popular in the army.

Midst the tropical vegetation near the site of the ancient city of Memphis.

### Peculiar!

A Scottish rider describes an experience which some reader may possibly be able to parallel, though I cannot. He was driving a chain-driven single-cylinder over beautiful roads, which were just dry, and returning on his tracks down a gentle hill of 1 in 20 a quarter of an hour or so after the impressions had been made on the road, noticed that the sun showed up a slight periodic deepening in the track at regular intervals; he considers these marks indicate the moments at which his engine fired. It looks rather as if this correspondent were trying to pull my leg in respect of one of my well-known fads; but, for the nonce, I will only say that I have driven much harsher machines than the one in question, and, though I personally have felt their explosions quite deeply, I never noticed that the road was equally sensitive! [We have also noticed indications of wheel slip on a similar machine when the road has been muddy and the pace slow.—Ed.]

### The Wear of Flat Twins.

A Douglas rider is excessively annoyed with the correspondent who gave "a short life and a merry one" as his impression of flat twins. He is accustomed to buy a new 2¾ h.p. Douglas every season, and averages 7,000 miles per annum, half of which is covered with a sidecar. His annual cash depreciation is nominal, the machines are as fast at the end of the year as when they started work, and they need no replacements. Of course! As I have often said, inferior torque and inferior balance do any engine far more harm in the way of wear than high engine revolutions. Too many people leap to broad generalisations on the strength of a single experience; and the single experience is often based either on a third-rate machine or a third-rate owner. There are flat twins of inferior quality, just as there are singles of inferior quality, and accurate comparisons are only possible either to an engineer, who can deduce the probabilities on technical grounds, or to a practical rider of wide experience.

### Foolproof Oiling.

There was a time when I was very enthusiastic about drip-feed oiling, though I don't know that I ever committed myself violently in print on that subject. They were happy days, now gone for ever, when I did nineteen-twentieths of my road work on one machine, and knew it inside out. Under such conditions a careful rider soon learns how to set his drip; the first thousand miles supply a few tell-tales in the way of a hot and smelly engine now and again, a sooted plug or so, and the undue rapidity of carbonisation if the supply is excessive. Well inside this distance, the observant driver should know the proper drip setting for all ordinary conditions. But nevertheless I feel a grave misgiving as to the suitability of the drip for the general public. At present, as for several years

past, I seldom have less than three machines in my stable, of which, perhaps, one is my private property, and the other two may be on test for the trade, or being tuned up for a chum; and these two may give place to others once a month, or even oftener. Under such conditions it is impossible to know where one is with the drip; just as one is mastering the setting of a new engine, another machine comes along, and one has to start all over again. The consequence is that one usually over-oils a little to be on the safe side. I wonder whether many careless owners ever master their drip feeds. I notice that the American makers do not credit their clients with the necessary intelligence, but prefer a mechanical supply; that several of the more go-ahead British makers are of the same opinion; and that such engines as the 3 h.p. Enfield, the 4 h.p. Douglas, and the W.D. certainly relieve the driver of much responsibility. During the war inventors have been active in this direction, and events seem to be shaping themselves for a much wider adoption of mechanical lubrication after the war.

### Overhead Valve Gear.

It is probably true that the M.A.G. engine is the only motor cycle engine possessing a durable overhead valve gear, and this protected gear is not the ideal in point of accessibility. I used to agree with "CP 450" on this point; if we compare the overhead valve gear of the Rudge with the side-by-side valve gear of the Triumph, we get no material increase in efficiency for our money; wear—with its concomitants of noise and impaired valve timing—is certainly more rapid; and the underneath valve is not improved in accessibility. On the other hand, each type of engine, the Rudge, the M.A.G., and the Triumph, has its own indefinable *cachet*—some mysterious combination of running qualities—which appeals to different temperaments; and, as a consequence, we find Rudge, M.A.G., and Triumph enthusiasts, each conversant with the other engines, each aware of the technical and practical *pros* and *cons* of each design, and each resolutely refusing to swop makers. But I think one may go a step further than personal taste when one is speaking of an overhead *exhaust* valve. You cannot dry up such an engine. Its valve gear may wear before the side-by-side type wears; its underneath valve may be less accessible; but its cylinder is relieved of the usual hot place down one side; expansion is even as the engine warms up in a colossal scrap or hill-climb; and, provided you have a well-cooled sparking plug, you may run that engine all out for miles together, particularly if its piston and cylinder metals have properly selected coefficients of expansion. In other words, the cost of replacing a rocker bush every six months is only a shilling or thereabouts; and one can conceive conditions under which that modest outlay is thoroughly justifiable.

## Road Experiences with a 3 h.p. Enfield.

A Commentary embodying some Valuable Riding Hints by a Practical Owner.

Valve side, showing auxiliary petrol tank connection to starting jet in induction pipe, the latter being lagged.

Note the hot air intake and petrol pipe bearing against back cylinder. This view also shows the stop for kick starter.

FOR some-weeks past I have ridden, almost daily, a latest model 3 h.p. twin Enfield, and as this machine belongs to a class which may be regarded as very desirable from the point of view of the solo rider, a few notes regarding its running will probably be of interest.

In these days of all-round perfection, it is often very difficult to decide whether a small twin, on the lines of the Enfield, or a  $3\frac{1}{2}$  h.p. "single," is the better adapted to one's requirements. On the one side we have vibrationless running, speed on the level, and extreme economy; on the other side we have a wonderfully docile engine, power on hills, and a machine which requires an absolute minimum of attention. The tendency of design with small twin cylinders to-day is to produce an engine that will "rev" indefinitely, and one of the great secrets in handling such an engine lies in "keeping up the revs"—particularly when using a heavy fuel. The charm of a perfectly even torque, smooth and rapid acceleration, a silent exhaust, and vibrationless running must be experienced to be appreciated.

### Speed and Economy.

The Enfield possesses three excellent features. The first is its remarkable economy, the second its smooth running at all speeds, the third the extraordinary speeds the engine is capable of attaining and *maintaining*.

As regards economy, I have not tried to achieve anything unusual in fuel consumption. Riding in a mountainous district the consumption averages out at 88 m.p.g., but I have not the least doubt that, at a slight sacrifice of power, one could obtain 110-120 m.p.g. as a regular thing. I have ridden Enfields that do 140 m.p.g., but they were not remarkable for vitality. Economy in tyres and transmission interests me much more than m.p.g., for the former rests with the designer, while the latter rests chiefly with the rider—or tuner. The rear tyre on my machine is very little worn after 3,000 miles. It should do 5,000 on the back and 2,000 on the front without risk—barring

cuts. The front tyre would almost sell as new, and the chains are perfect.

The Enfield transmission system is really excellent. I have locked up the slipping ring device, yet there is not the faintest suggestion of snag till the engine absolutely konks out. Even when the machine jogs along on one cylinder for a few yards—as it often does with a heavy fuel—no suggestion of solidity in the drive is conveyed to the rider.

This accounts, of course, for the unusual tyre wear, while it has not a little to do with the vibrationless running. The machine "zips" along at 37 m.p.h. without a tremor, and is good for an occasional burst of 50 m.p.h. with no danger of overheating. Riding between London and Leeds, it is 3 m.p.h. faster than my last  $3\frac{1}{2}$  h.p. single, and that single was no sluggard.

All things considered, the Enfield is quite a cheerful little beast. One can drive out all day without touching one's pocket or a spanner. It purrs up our interminable mountain slopes at 22 m.p.h. on low gear, taking top without a murmur immediately the gradient slackens, and withal it is absurdly cheap to run! But it requires more attention than, say, anything so monotonously reliable as a Triumph or P. and M.

### Heavy Fuels—An Unsolved Problem.

The running of the machine was perfect in every way till, from stern business necessity, heavy fuels became the daily order. Then the band began to play. For a week or so the engine runs as well on the heaviest of mixtures as it does on petrol, but at the end of the week irregular and faulty running sets in. The engine never lacks power; it merely cuts out on one cylinder or fires irregularly. The most careful search has been made for air leaks, the ignition system thoroughly overhauled, and carburetter minutely examined. The fault is never cured; it merely cures itself.

Certain fittings were, of course, necessary ere the machine could be run with safety and satisfaction on heavy mixtures. With the Enfield it is particularly

**Road Experiences with a 3 h.p. Enfield.—**

necessary to guard against bad carburation, for the oil is circulated through the engine by means of pumps, the surplus being returned to the oil tank. Neglect of obvious rules would lead to the oil becoming thinned, with resultant worn bearings, and probably a seized piston. The obvious rules are: Fit an efficient hot air intake; if the induction pipe is of any length, lag it to prevent the escape of heat; if possible, warm the fuel before it reaches the float chamber, and keep it warm while it rests in the float chamber.

The hot air intake was made out of the bend of an old double twist horn. Nothing better could have been arrived at, the bend being wider at one end than at the other, so that the hot air is drawn from an ample surface. The end of the pipe which fits up against the cylinder is deeply grooved, so that it draws air actually from between the fins. The bend is lagged with insulation tape, it being made of such thin stuff that it is not capable of retaining heat. This arrange-

Copper clip for warming float chamber.

ment, I find, is quite sufficient to warm the whole carburetter, and it may be added that the function of a hot air intake is not merely to supply warm air, but to warm up the whole of the carburetter body. Unless it does this it cannot be regarded as efficient, as the carburetter is a massive piece of metal, which will absorb the warmth of the vaporised fuel if the metal be at atmospheric temperature or below.

**Warming the Float Chamber.**

The fuel pipe from the tank was next shaped so that it bore hard against the back cylinder for the greater part of its length, and by this means the fuel is brought well above atmospheric temperature ere it reaches the float chamber. It remains there, however, quite long enough to cool down, and the next problem was to warm the float chamber by some means. To effect this a copper clip was made to fasten round the float chamber as shown in the sketch, its ends bearing hard against the back cylinder. Normally, the clip is too hot to hold at A, and quite perceptibly above the temperature of one's hand at B. When the machine is stationary, or after much low gear work, it is quite hot at C, and thus it cannot be doubted that it imparts an appreciable degree of warmth to the float chamber.

With these fitments the machine was subjected to a practical road test on a fuel a good deal heavier than it was ever intended to use, but there were distinct symptoms of imperfect carburation. It was then pretty clear that bad carburation was not the fault; condensation was the culprit, and accordingly the induction pipe was heavily lagged with asbestos twine, wrapped over with insulation tape. This made all the difference in the world, and, except for the occasional fits already alluded to, the heavy fuel problem is mastered. That the heavy fuel *does* have some effect upon the lubricat-

ing oil is proved by the rapid discolouration of the oil when a heavy fuel is used. After circulating a few times it becomes a deep brown—almost black—whereas, with petrol as the fuel, the oil in the tank retains its greenish tinge till the tank is drained. But there are no indications that wear in the engine is taking place.

**Enfield Lubrication System.**

Many riders of Enfield machines have hesitated to adopt heavy fuels on account of the lubricating system. If bad carburation occurred the fuel would escape past the piston rings and gain the oil in the crank case, and, since the oil is constantly circulating, it would absorb more and more of the fuel, thus becoming dangerously thinned. Perfect carburation is, of course, the only safeguard against this, and if the fitments described be adopted, I do not think there is the least danger in using heavy fuels on the machine under review. So far as starting goes, an injection of petrol is all that is required, but to avoid the nuisance of carrying an injector, which is apt to run dry, I have fitted my machine with a small petrol tank, which is connected up to a pilot jet fitted into the induction pipe. By turning on the tap under the small tank it is thus possible to flood the induction pipe with petrol, and a very easy start is made.

Returning to the lubricating system, this is much preferable to the ordinary drip feed, as it is economical and requires no attention while on the road. But just as in the case of the drip feed the absent-minded rider forgets to push down the plunger and thus starves his engine, so, in the case of the Enfield system, he forgets to turn off the oil on reaching his garage, and next morning the contents of his oil tank have percolated through into the engine. The engine then remains filthy externally till next cleaned, though, when started up, the pump returns the oil to the tank in a few seconds. Still the system would be much improved if it were not necessary to turn off the oil when garaging the machine.

The gravity feed to the wall of the front cylinder is a necessity, and I find that if I omit to turn this on, the top piston ring of the front cylinder gums up in 500 miles. I have removed the bottom ring from the front piston, and this has also helped to cure the sticking of the top ring.

Forcing grease into the Enfield gear by the use of a grease gun. This is a more permanent way of oiling than the usual method.

## Road Experiences with a 3 h.p. Enfield.—

## Ignition System.

The Thomson-Bennett magneto is a well designed and remarkably accessible little instrument which any novice can take to pieces and replace without difficulty; but the one on my machine possesses one fault. It is not waterproof.

With the usual thoroughness of workmanship manifested throughout the design of the instrument, thin packings are inset round the edges of the aluminium end plates, which draw up against the magnets at either end, but there is evidently just enough spring in the aluminium plates to cause the joints to gape open at the top. This I have cured by fitting a simple clip, which serves to draw the joints well home. There should, of course, be no necessity for such gadgets, but before the addition of the clip I was troubled by water getting in and rusting the armature and magnets.

It has often occurred to me how much more handy it would be if hexagon-headed setscrews were used throughout in magneto construction instead of the counter-sunk screws, which require the use of a screw-

driver, the latter being quite an inadequate instrument when a screw has become rusted in. If this were done the key provided for contact breaker adjustment would be the only tool required to take the magneto apart.

## Two-speed Gear.

At first I was not particularly in love with the gear, though I found it a vast improvement on the simple dog-clutch mechanism of my last semi-lightweight. It has, however, improved immensely with running, and now leaves nothing to be desired—unless possibly a combination (hand and foot) control. I can start off with perfect smoothness on a 1 in 5 gradient, and such feats were impossible when the gear was new.

I have ceased using oil for this gear and now use vaseline or gear grease, which is forced in by the use of a grease pump having a screw-down plunger. I find this way of lubricating far more permanent than the usual method.

## Kick-starter.

The kick-starter is rather apt to stick, automatically releasing itself at the exact moment when one's left shin is in its direct line of travel. I have improved it very considerably by fitting a stop. This prevents the crank from attaining a position from which the necessary push forward can be given only after manoeuvring the crank over dead centre.

All things considered, the 3 h.p. Enfield is a very desirable solo mount. It is cheaper to run and less tiring to ride than most 3½ h.p. singles I have possessed, and for speed it is distinctly superior to the average "big single." That it periodically objects to heavy fuels is no criticism of the machine itself, as any aristocratic mount would object to some of the obnoxious mixtures to-day sold as motor fuel.

H.M.B.

## A Well-designed Sidecar.

A family sidecar turnout, assembled by the owner, who is seen mounted on the machine. Some details are appended.

THE well-equipped motor cycle and sidecar we illustrate was built by C. Edwards, Gorton, Manchester. The sidecar especially is designed on exceptionally pleasing lines. At the back of it is a box arrangement, which opens and forms a dickey seat, and the lid being upholstered forms a padding for the back. When not used for a passenger, it forms a luggage carrier of good dimensions. The small running board, continuing from a sensible mudguard,

swings over when repairs are being done to the wheel, and it also adds to the appearance of the turn-out. A point of interest in connection with the motor cycle is the mudshield of ample size, which keeps the engine perfectly clean. The seat on the luggage carrier is sprung, and is also home-made.

Mr. Edwards informs us that his outfit has been running eighteen months, during which period it has given him entire satisfaction.

# WILL THE SINGLE-CYLINDER SURVIVE?

## The Trade Delivery Aspect of a Burning Topic.

SO far one very important point seems to have been overlooked in the controversy on the above subject—that is the future possibilities of the three-speed single-cylinder machine for business and commercial use. It is only during the last year or so that tradesmen have taken to the motor cycle at all for delivery purposes, but it is now becoming more and more generally realised that the side-car affords the cheapest, quickest, and most convenient method of carrying out light delivery work, and that a vast future awaits the really serviceable commercial machine cannot be doubted. For this kind of work absolute simplicity, reliability, and strength are the prime essentials.

### Judicious Management.

It seems to me that those who have so far entered in upon the discussion are expert riders, who are inclined to judge the matter from their own point of view. In the hands of "Ixion" and "Road Rider" a small, highly efficient twin doubtless gives unqualified satisfaction, since they know just what plug to use, the best setting for the carburetter, etc., under various

The high efficiency twin of to-day is doubtless reliable, but its reliability is more dependent on the knowledge of the rider and the attention he gives it than is that of the single. And the machine which will best fill the bill as a commercial proposition is the one which will cover its allotted mileage with an absolute minimum of attention.

### Commercial Requirements.

Personally I do not think there is a great future for the single as a pleasure mount, but for trade and business purposes it will undoubtedly hold its own. The chain-driven single of  $3\frac{1}{2}$ -4 h.p. is undoubtedly the most suitable machine at present on the road for the serious business rider and for local delivery. The neglect and exposure to which many commercial machines are subjected really pass all belief; not only do they cover an immense mileage, but they are out in all weathers, and often left standing in the rain for hours. Doubtless the big twin will put up with a good deal of this sort of thing, but the single is cheaper to buy and to run, amply powerful, and probably requires less attention than the twin.

During the last six months practically all my riding has been done on small twins of the high-efficiency order or on still smaller two-strokes, and if to-day I mount one of my old favourite "singles," I am absolutely appalled by the manner in which the engine seems to dominate the whole situation. Yet if I were called upon to go the round of the A.C.U. Six Days, with bad weather probable and bad roads certain, I should risk permanently shattering my nervous system and choose the "single," though for reasonably good roads the small twin is unquestionably the more comfortable and the less tiring to ride.

MIDLANDER.

SCENES NEAR THE ITALIAN FRONT.

(1) The arrival of a section of Italian army motor cyclists at a rallying point by the side of the Lake de Garde en route for the Front.

(2) One of our Italian Ally's primitive garages for motor cycles situated in the Alpine region.

Motor cycles are used on the Italian Front wherever the roads are practicable, and they have to withstand much severe handling. Incidentally, British machines show up prominently in our photographs.

conditions, and if the machine does not run just as it should they are able to put a finger on the fault and remedy it. With a less experienced rider, the fault might continue for days, and the whole tune of the engine would duly become upset.

A selection of questions of general interest received from readers and our replies thereto. All questions should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, London, E.C., and whether intended for publication or not must be accompanied by a stamped addressed envelope for reply. Correspondents are urged to write clearly and on one side of the paper only, numbering each query separately, and keeping a copy for ease of reference. Letters containing legal questions should be marked "Legal" in the left-hand corner of envelope, and should be kept distinct from questions bearing on technical subjects.

### Difficult Starting.

**?** I have recently purchased a 1914 Douglas, which does not start well. It will start when a handkerchief is placed over the air inlet, and when it is running on the stand it will not take any air. Please tell me what is the matter, and how to cure the trouble.—H.K.

Probably the air slide is badly worn in the carburettor and requires to be renewed. Also, see that there are no air leaks at the carburettor or induction pipe unions, and if the jet is quite clear try the effect of fitting a smaller air choke. The Douglas usually starts very easily.

### Lubrication.

**?** I have a  $2\frac{1}{2}$  h.p. Chater-Lea with a Villiers engine. I wish to fit a drip feed instead of the petrol system now in use on it. Will you please tell me if this can possibly do any harm? Also state whether the oil pipe from the pump should be led into the induction pipe or straight into a hole bored in the crank case, in which case, I suppose, there would have to be a non-return valve.—E.R.

A drip feed can be fitted with quite satisfactory results. The oil pipe can be fitted either to the induction pipe, so allowing the oil to be drawn in with the mixture, or it may be taken direct to the crank case. If this is done, it will of course be necessary to fit a non-return valve. The former system is probably the most satisfactory method all round, as you practically combine the petrol and drip feed systems without the messiness of the former.

### Soldering on a Bowden Nipple.

**?** Would you be good enough to give me directions for soldering nipples on Bowden wire? I propose using spirits of salt killed with zinc as flux.—E.McC.

The best method of soldering on the Bowden nipple would be the following: Before cutting the wire smear on any soldering flux you think of using, and then rub your iron lightly round the spot where you wish to cut it, having previously well tinned the iron. This has the effect of tinning the wire, or covering it with a thin layer of solder, and it will not fray when cut. The joint is now ready tinned for fixing on the nipple. All you have to do is to slip the nipple in position so that about one-sixteenth of an inch projects beyond the head. Apply the iron to the nipple and the heat will cause the solder to run. Finish off by hammering the short projecting piece of wire flat, and securing it with a blob of solder.

### Bad Steering on Grease.

**?** I should be extremely obliged if you could give me any advice with regard to the following difficulty: I have a 1912  $3\frac{1}{2}$  h.p. single, and find it unsteady to drive at anything like a decent speed. It was not new when I bought it, and had been fitted with quite a late pattern spring fork, about 1914 or 1915. If the road is smooth the unsteadiness is hardly noticeable, but should the road be at all uneven or muddy, there is a most unpleasant tendency to "sway" about. I ride with good hard tyres, and the wheels are in good condition. There seems to be a small amount of give in the forks; do you think this would cause the unsteadiness?—E.C.

It is quite possible that the unsteadiness on grease may be due to the frame being out of line on account of a fall at some time or other. You should very carefully go over the machine and make certain that the wheels are absolutely in track, and that the frame is not twisted in any way, or the steering angle set back at all. The only place that wear might affect the steering is in the bearing on which the forks pivot, and this wear would have to be fairly considerable to have much effect on the steering. A common cause for bad steering on grease

is too tight a steering head. When the front wheel is jacked up the steering head should swing quite easily of its own weight.

### Aids to Cooling.

**?** I find that my 1914 Triumph heats up a good deal with a heavy person in the sidecar. I noticed in one issue of *The Motor Cycle* a suggestion for putting short pieces of copper tubing between the radiating flanges on the cylinders. Could you tell me:

- (1.) How many pieces of tubing would be needed and of what length they would have to be?
- (2.) Whether this method would be as effective as the aluminium auxiliary radiators?—V. de P.

(1.) Instead of putting copper tubing round the cylinder in this manner it would be better to use a ready-made device consisting of coiled wire, in the form of springs, which can be obtained from most accessory firms.

(2.) We should say that if anything the aluminium radiators might be a little more effective.

There is still another alternative, and that is to reduce the compression by fitting a plate between the cylinder and crank case about one-sixteenth of an inch in thickness.

LADY MOTOR CYCLIST ON FARM WORK.

In the early days of the war Miss Joan Sill offered her services for farm and garden work, and is at present employed on a large estate near Evesham. As the acreage is extensive she appreciates the handiness of her  $2\frac{1}{2}$  h.p. Enfield. The photograph depicts Miss Sill giving instructions to a labourer.

**Variable v. Fixed Ignition.**

**?** (1.) My engine, 2½ h.p. single, four-stroke, knocks badly on top gear at speeds below about 15 m.p.h. The ignition is fixed, and was set much advanced. I tried retarding, somewhat, without effecting improvement. I notice that the piston rises about ¼ in. or ⅜ in. into the combustion chamber when at its highest point. Should this be so? If not, it seems as if the extra high compression thus caused might occasion the knocking. (2.) The engine runs well at speeds of from 20 to 25 m.p.h.; above this there is much engine vibration till 35 m.p.h. is reached, when the running becomes quite smooth. Are these phases due to the way the engine is balanced? (3.) What are the disadvantages in using a multiple-point plug in a single-cylinder engine?—A.G.

(1.) Your ignition is still probably too far advanced; try retarding it more. The knocking might also be caused through too weak a mixture. When the knocking occurs, close the air slightly. We presume the bearings of the engine are in good order; if not, this would account for the knock. Yes, it is quite in order that the piston should rise a certain distance into the combustion chamber. We do not think you will find that the compression is excessive. (2.) Yes, the vibration periods are due to the manner in which the engine is balanced. You might make sure that the engine is securely bolted in the frame. Worn bearings would also cause vibration to be excessive. (3.) The disadvantages are none. The advantages, however, of the multi-point plug are practically nil, as the spark always takes the easiest path.

**Charging from Dynamo Outfit.**

**?** Will you kindly oblige by answering the following queries: I have a magneto-dynamo Indian. This will run all lights, both cycle and sidecar. I have a six volt 64 a.h. accumulator. (1.) Can I charge this from the dynamo? (2.) Should I connect the two accumulators, or remove the original and connect the other (which would be in the sidecar) in the same manner as the one now fixed? (3.) If I charge a hand lamp accumulator, could I do this off the big battery, or should it be done through the dynamo? (4.) Would the length of wiring to sidecar interfere with the give-and-take system of charging, etc.? (5.) If I turn the main light out before the rear might this destroy the small bulb fitted to the rear lamp?—S.H.R.

(1 and 2.) Yes; you could certainly charge this from the dynamo. We think you would find it more satisfactory to change the accumulators over when charging. It would be possible to charge the two together by connecting in parallel, so making one large battery of the two; but you would find the charging this way very slow unless the number of amperes passing were pretty high. (3.) Yes; you can charge the smaller accumulator from the larger one, provided the number of volts and ampere capacity of the charging accumulator are greater than

those of the smaller one. It would be necessary to insert a lamp in circuit as resistance. (4.) It is not advisable to have a longer length of wire in circuit than is absolutely necessary. (5.) No; you should be able to switch off the head lamp before the tail light without damage to the tail lamp.

**Irregular Running.**

**?** My 1913 air-cooled Morgan-Jap (B. and B.) is not going as it should. It will run sometimes for four or five miles very well, and then without any alterations will slow down to almost a standstill, then will set off again and go just as well as before. Sometimes when slowing down it will back-fire rapidly but not every time. When standing, the engine runs perfectly, and I have tried braking the flywheel to make it behave as it does when going on the road, but cannot. Will you please tell me what to do with it?—PSYCHE.

We should say that the trouble is probably due to some obstruction in the carburetter, quite possibly water. Water in the carburetter or petrol pipe would cause the symptoms you describe in your letter. We should, therefore, recommend you to overhaul the petrol system carefully. Also make sure that the valves are working freely in their guides and that the valve springs are strong enough.

**Timing a Two-stroke.**

**?** (1.) My machine is a two-stroke. When the engine is forced up a hill or when going over fourteen miles an hour, the piston suddenly commences to rattle, the engine gives no power, and the cylinder becomes fairly hot. A change of plug makes no difference, and the trouble appears to be getting worse. The engine has lately been cleaned.

(2.) The ignition is set as follows: Piston dead on top, ignition lever fully advanced, the points are about to break. Should not this be the position when the lever is fully retarded?

(3.) There is no name on the magneto, and so far as I can see I can only advance the spark by altering the chain one tooth. How can I advance the magneto without taking off the chain? There is only a large nut on the sprocket wheel of the magneto—is this for altering the timing?—C.G.E.

(1.) You might try fitting a slightly smaller jet.

(2.) The usual magneto setting for a two-stroke is so to arrange the magneto that the points have just broken with the piston on the top of the stroke and the spark fully retarded.

(3.) If you remove the nut and lever off the sprocket you will find that this is a taper fit on the shaft. This will allow you to replace it in any position, and on screwing up the nut the taper will secure it. Set the magneto according to the instructions given, and again verify the timing after you have replaced the sprocket so as to make sure the wheel has not shifted while you were screwing up the nut.

**Electric Lighting.**

**?** I have fitted electric side and tail lamps to my sidecar. (1.) Could I work them from a four-volt dry battery of good quality? I do very little night driving. (2.) What kind of electric bulbs should I use (volts and amps.), and where are these obtainable?—S.C.

(1.) Yes; the lamps in question could be worked off a four-volt battery; but an accumulator would be better. (2.) Any four-volt metal filament bulb would be suitable, provided it fits the sockets of the lamps. The larger the candle-power of the lamps the more current is consumed. The bulbs can be obtained from any accessory dealer.

**RECOMMENDED ROUTES.****MANCHESTER TO LONDON.—W.B.H.**

Manchester, Cheadle, Wilmslow, Congleton, Leek, Uttoxeter, Abbot's Bromley, Lichfield, Weeford, along Watling Street through Atherstone to Daventry, Towcester, Stony Stratford, Fenny Stratford, Dunstable, St. Albans, Barnet, London.

**PERTH TO BARROW-IN-FURNESS.—J.C.**

Perth, Auchterarder, Dunblane, Stirling, Denny, Newmains, Carlisle, Lanark, Symington, Abington Inn, Beattock, Lockerbie, Ecclefechan, Carlisle, Penrith, Shap, Kendal, Tarnside, Newby Bridge, Haverthwaite, Ulverston, Dalston, Barrow-in-Furness. The distance is approximately 220 miles.

**ST. ALBANS TO CHICHESTER.—C.G.E.**

St. Albans, Watford, Rickmansworth, Denham, Uxbridge, Staines, Chertsey, Woking, Guildford, Godalming, Haslemere, Fernhurst, Midhurst, Singleton, Chichester.

# A "BIG FOUR" NORTON FOR OVERSEAS.

A Machine Specially Designed  
for Colonial Requirements.

4 h.p. 82 x 120 mm. = 633 c.c.  
Three-speed Gear.  
Chain Transmission.

The new 4 h.p. (633 c.c.) Colonial Model Norton, showing engine ground clearance of 6½ in. The straight exhaust pipe is a feature of Norton motor cycles.

TO the home reader motor cycling in the Colonies conjures up visions of wild wastes of sand and rock; devoid of any kind of road, perilous crossings of rivers in flood, or deep dried-up water courses, and adventures with wild animals, these ideas being derived chiefly from accounts of exciting cross-country journeys as recounted in our columns from time to time. In reality the Colonial motorist avoids such "stunts" whenever possible, and endeavours to find and use the best roads in his district. This probably means something worse than the worst of our English roads, and for this reason we frequently hear complaints from Overseas readers of the unsuitability of English standard models. The chief defects are want of ground clearance and insufficient or unsuitable mudguarding.

## Ground Clearance.

British manufacturers are rather backward in remedying these defects, and it is with considerable interest that we give details of the latest product of Norton Motors, Ltd., Phillips Street, Aston, Birmingham. This machine is quite a special design, and not merely a standard model altered in detail. Its outstanding

feature is exceptional ground clearance; there are 6½ in. to spare below the crank case. This increase, about 2½ in. more than the standard type, is obtained by a careful rearrangement of the frame tubes and the Norton method of carrying the gear box. A horizontal stamp-

Sectional view of piston, showing method of webbing the head. The lower sketch shows the gudgeon pin, its stop and split fastener.

ing is cranked up behind the engine, under which the Sturmey-Archer three-speed countershaft gear is bolted, so that no part of it projects below the bottom of the crank case. A vertical tube fitted below this platform carries the footboards rear support and also the back brake operating levers. In passing, we note that the S.A. three-speed is now made to give a slightly lower ratio on the first speed than previously.

The head and saddle lugs are long and substantial, and the whole frame is undoubtedly strong. Whilst on this point we were interested to see a Norton machine which had suffered badly in a direct end-on collision at high speed; what happened to the unfortunate rider did not transpire, but it is remarkable that no breakage had occurred in any tube or lug, although the frame was distorted beyond hope of repair. For

the Colonial model the tank has been increased in size to accommodate two and a quarter gallons of petrol and over three-quarters of a gallon of oil; this necessitates a deviation from the usual Norton shape of tank, noticeable principally at the front, and also on the right-hand side, where a small recess is formed to permit easy removal of the valves.

## The Power Unit.

The engine is the Norton "big four," 82 x 120 mm. bore and stroke, giving 633 c.c., but with certain improvements. Roller bearings to the mainshaft are now fitted. Three extra radiating fins have been added to the valve pockets, and vertical ribs on each side. The piston is improved by the addition of six ribs in the head to prevent distortion, as illustrated on November 9th, and, although not new, the method of securing the gudgeon pin is interesting, it being a parallel fit, held in place by a small stud and socket at one end and a small cotter pin at the other—a method which prevents rotary as well as in and out movement, while there is little likelihood of parts coming adrift.

The leg shields fitted to the Colonial Norton are of sensible dimensions and extremely effective.

The bottom bracket formation, showing slots allowing gear box to be slid along, also manner of fixing brake rod and pedal.

The clean design of both cylinder and crank case is immediately noticeable, the sharp edges and corners of the crank case being rounded off, enabling the surface to be cleaned easily.

The back mudguard is 7in. wide and set 2½in. away from the tyre tread, with no restriction at the forks; it is given additional strength by a central liner, throughout the whole length. The front guard is also wide and set the same distance from the tyre, the bottom edge being kept at crank case level, 6½in. from the ground. Additional leg shields can be fitted if desired; they are neat in appearance, and provide ample protection. Heavy chain drive throughout is to be standard, but chain-cum-belt transmission can be supplied. The chains are protected by a strong, serviceable metal cover, but it is intended to market a completely enclosing type of chain case. The 3in. Dunlop tyres on 2½in. rims give a very substantial appearance to the 26in. wheels. Handle-bar clutch control, B. and B. carburetter with starting jet, and a chain-driven C.A.V. magneto complete a very fine model.

Although of special design for Overseas, we see no particular reason why it should not become popular in this country, as its deviations from standard practice in no way decrease the usual Norton good points of speed and power, coupled with reliability in every way. It undoubtedly fills the bill for the needs of the average Colonial rider, and the makers look forward to a considerable demand when business resumes its normal course after the war.

Norton Motors, Ltd., can supply two types of sidecars to suit any make of machine, the de luxe and the sporting model. Both give ample leg room, and also capacious lockers. The springing is

Recess formed in underside of tank to facilitate valve removal.

well designed, rendering them exceedingly comfortable, whilst both coachwork and fittings are excellent. The lines of the sporting model are attractive, and when combined with the Norton machine, for which it was primarily intended, it makes up as smart an outfit as one could wish.

The Sporting Model Norton sidecar, showing spacious locker in rear.

Transmission side of the Colonial Model Norton with gear case removed. A special feature is the high position of the gear box, which is built well up into the bracket, giving good ground clearance.

## AVERAGE PRICES.

WE give below the average prices of second-hand models offered for sale in *The Motor Cycle*, where it is possible to obtain a sufficient number of each model.

Make.	Year.	H.P.	Average for last week.	Latest weekly average obtainable.

## TIMES TO LIGHT LAMPS.

## GREENWICH TIME.

Nov. 30th	...	...	4.24 p.m.
Dec. 2nd	...	...	4.23 "
" 4th	...	...	4.22 "
" 6th	...	...	4.21 "

## Lights on Cattle.

Last week, for the first time, we saw the leader of a horse carrying a light in compliance with the recent Order under the Defence of the Realm Act. However, he did not comply correctly with the regulations, for the light he carried was a red one.

## Indian Flat Twin Deliveries.

We understand that deliveries of the new Indian flat twin lightweight will commence in America about the middle of December. Arrangements have been made for the manufacture of 7,500 of these little machines, and already the demand exceeds half this number. In America these are to be sold for the extraordinarily low figure of \$165 = £33.

## Motor Cycles in Request.

Among the various offers in exchange for motor cycles and combinations, to be found in the last two issues of *The Motor Cycle*, are: Thoroughbred horse, sure Derby winner, 20 h.p. motor car, freehold cottage in Devonshire, diamonds, jewellery, motor launch, watches, pleasure trap, typewriter, flute, piccolo, banjo, violin, and a sugar boiler.

## Two-stroke Wails and Praise.

There must be either an extremely wide difference in the driving of two-strokes of the same make, or a great disparity between identical models. One hears nothing but praise from a certain section of two-stroke lovers; on the other hand, these little mounts are condemned far more hotly than the flat twin enthusiast condemns the thudding singles. Why this strong divergence of opinion? Is it solely lack of uniform efficiency in the manufacture, or the driver's fault every time?

## 300 Miles in 48 Hours.

A strenuous test, both for man and machine, was carried out recently by two Harley-Davidson riders attached to the Pittsburg Military Training Company. They left Pittsburg at 7.30 a.m., carrying a despatch from the Mayor of Pittsburg to President Wilson. The journey to New Jersey, where the President was staying, is 400 miles, and the ride was accomplished in just over eleven hours. The return journey was started the following morning, the riders reaching Pittsburg the same evening, thus accomplishing the double journey of 800 miles in two days.

B8

## Dunlop Rubber Co., Ltd.

At an extraordinary general meeting of the Dunlop Rubber Co., Ltd., held on November 22nd, resolutions were confirmed authorising the increase of the capital of the company to £3,000,000 by the creation of 1,000,000 new shares of £1 each, to be called B preference shares.

## Ten Years Ago.

Even in 1906 *The Motor Cycle* was endeavouring to stimulate interest in spring frames. Yet years lapsed before the British manufacturer would heed the cry, and now only comparatively few machines are turned out as standard sprung both front and rear.

In the leader for November 21st, 1906, we said, "Spring frames are still few and far between, and it is a matter of surprise to us that more makers have not turned their attention to springing both the front and the rear of a motor cycle. Spring frames will be standard some day, we feel sure, but for the present we must console ourselves with the excellent spring front forks now almost general."

Many of us to-day have to content ourselves in the same way, but we think, after the war is over, spring frames will be standardised on many machines.

## SPECIAL FEATURES.

THE TANKS—AND NEUTRAL NOTIONS.

AIRCRAFT WORKERS' HILL-CLIMB.

ROAD EXPERIENCES WITH A  
3 h.p. ENFIELD.

## The Aluminium Market.

Shall we eventually see steel or iron crank cases in place of aluminium? It is acknowledged in America that the state of the aluminium market is serious. It is easy to add two and two together in this country, and come to the conclusion that if it is scarce in America it is sure to be scarcer here, in view of the manufactures in the future that will absorb much of that light metal.

## Great Motor Factory for Cork.

The Cork Corporation and the Cork Harbour Commissioners have accepted the offer of the Trafford Engineering Co., Manchester, to purchase for £10,000 Cork Park racecourse and ground abutting the quays for the purpose of erecting a motor factory, with a stipulation that £200,000 should be expended on the buildings, and a guarantee to employ 2,000 persons.

A despatch rider attached to the Italian headquarters. His mount is one of the 100 Douglases which have been supplied to the Italian Government.

**The Royal Dutch M.C.C.**

The Dutch Motor Cycle Club has received the patronage of the Queen of Holland, and will now be known as the Royal Dutch Motor Cycle Club.

**Proposed One Day Trial.**

We understand that the motor cyclists of the Royal Aircraft Factory are contemplating yet another competition for one day in the spring. This is to take the form of a one-day reliability trial.

**Road Guides in Wartime.**

A correspondent in the daily press has been questioning the need for road scouts in wartime. Certainly there are many war jobs more important than "minding a street corner."

**The National War Funds.**

At the week-end the principal war funds stood as follow:

The Prince of Wales's Fund (distributed £3,479,475) ..	£6,008,230	0	0
British Red Cross Fund ..	5,316,998	0	0

**A Luxurious Outfit.**

We are indebted to Mr. O. L. De Lissa for a most pleasant afternoon's run, on the occasion of the Royal Aircraft Factory's hill-climb last Saturday, in his 6 h.p. Motosacoche fitted with one of the latest M.A.G. engines. The smooth, silent running of the big twin engine was really delightful, while the comfort of the sidecar was luxurious.

**Bogus Tanks.**

Mr. Lloyd George said in Parliament last week that he had seen some American photographs of "tanks," and they bore no relation to the actual armoured cars. We have seen some, too, and have been greatly amused. Some cunning Yankees have quickly built up bogus tanks, and issued photographs, and, of course, neutrals have fallen into the trap!

**Praise for Motor Cyclist D.R.'s.**

General Sir William Robertson, in unveiling last Saturday a stone cross in the quadrangle of Bradford College, as a memorial to old boys who fell in the war, congratulated the college on what he described as its wonderful record in the war, and acknowledged the debt of gratitude which the War Office owed to all officers' training corps. What they would have done without them he did not know. Many of the junior officers' training corps and the universities accompanied our first fine army as despatch riders. Despatch riding in those days was a perilous business, and they did splendid work, ever ready to go where they were asked at no matter what time of the day or night. He remembered during the retreat, when things were, perhaps, at their worst, needing to get some instructions to headquarters. All his despatch riders were out, and there was no one to send. Presently two boys came in, "done up." They offered their services, but he said, "I cannot send you; you are not fit to go." They said, "Yes, we will go." They went, got through, and, he was glad to say, came back.

**The Petrol Outlook.**

The Director of the United States Bureau of Mines says that calculations, based on the present-day consumption of petroleum, have led the United States Geological Survey to conclude that the supply in America will not last longer than from twenty-seven to thirty years.

**The King's Painting.**

A painting by Mr. Alfred Pearse of a Tank in action has been accepted by H.M. the King. The sketch from which it was painted was made by a pupil who volunteered for the Front two years ago. The picture is in monochrome, and bears the pupil's name, as well as that of Mr. Pearse.

**The Motor Cyclists' Ideal.**

The seventh design submitted by readers of *The Light Car* is published in Wednesday's issue of that journal. These designs are sent in by amateur readers, and the one given this week is by a motor cyclist "somewhere in France," who says: "I look upon the majority of light cars as something in reserve for old age. My ideal light car is one which will give the same pleasure to drive as my late T.T. 3½ h.p. motor cycle."

**Export of Motor Cycles.**

The Wulfruna Engineering Co., of Wolverhampton, send us a copy of a communication they have addressed to the Minister of Munitions on the subject of the export trade, in which they point out the great importance of retaining this trade and Overseas markets, as far as possible, in British hands. They are of opinion that the markets can be retained if permits to export are freely given. Our views on this subject are already known to our readers, as we have repeatedly referred to its importance, and we should advise other makers to approach the Minister of Munitions in a similar manner.

**Road Record Breaking in South Australia**

An Australian correspondent tells us that soon after daylight on October 7th the officials of the M.C.C. of South Australia and the representatives of the Indian Garage motored a few miles north of Adelaide, on the main Gawler Road, to witness attempts on records by J. Booth (Victoria) and E. Ferguson (South Australia), mounted on eight-valve Indian racing motor cycles. The half-mile was timed by the club's electric timing machine and the one mile by club officials manipulating stop-watches.

Booth opened the programme for the half-mile, and clocked 19½s. Ferguson then got going, and clocked the half-mile in 19½s. (South Australian record). Booth made a second attempt, and again clocked 19½s. After a few adjustments, a third attempt was still unsuccessful, his engine misfiring badly; time, 20½s.

Booth was not allowed further time for half-mile trials, so he prepared for the one mile attempt, and the spectators saw something they are not likely to forget for some time. Booth got a good start, and with his engine firing regularly and revving splendidly he crossed the mile mark in 35s. = 102.8 miles per hour. This is stated to be a world's road record.

**Engines without Oil.**

An American firm has succeeded in impregnating graphite with metal, thereby combining the self-lubricating properties of the graphite with the tenacity of the metal used. It is interesting to learn this, and the question arises in the mind as to whether we shall eventually have an oilless engine and bearings.

**Petrol 5½d. per Gallon.**

The *Autocar* states that in the autumn of 1915 petrol was retailed in California at 5½d. per gallon, but gradually advanced until, in August, 1916, it reached 10d. per gallon. A highly satisfactory substitute can be obtained (one-third petrol two-thirds distillate) for 6d. per gallon.

**British-made Tungsten.**

At the commencement of the war the Germans practically held a monopoly in the manufacture of tungsten powder, which is derived from wolfram ore; and there was in this country only about three months' supply of tungsten. How the difficulty was met and conquered may be described as one of the romances of industry. Suffice it to say that there is now near Widnes a tungsten factory which is capable of producing three tons a day. Tungsten is interesting to motor cyclists from the fact that it is used in the manufacture of high speed steel. Valves are sometimes made of tungsten steel, and it also finds a place in magneto construction.

**The Admiral Arbuthnot Trophy.**

We recently had an opportunity of viewing Lady Scott's statuette of the late Rear-Admiral Sir Robert Arbuthnot, which she is executing for the Arbuthnot Trophy. It is a beautiful piece of work, and represents the late Admiral standing in his motor cycle suit in a characteristic attitude. The features are wonderfully well portrayed, and, considering that the talented sculptor never had an opportunity of seeing the Admiral, and has had to work entirely from photographs, the result is astonishingly good. The model we saw was in clay, but it will be finished in bronze standing upon a marble base, on which an inscription will be written, and into which the A.C.U. badge will be fixed. It is sincerely to be hoped that the time will not be long before the trophy may be put up for actual competition.

**Work on the Roads.**

It is, of course, unreasonable to expect that much repair work should be done on the roads, unless, as has been suggested in *The Motor Cycle*, German prisoners of war could be organised into gangs to perform it. However, it does seem somewhat ridiculous that what little work is done should be of an entirely useless nature. There has been a man working for weeks upon a stretch of road over which a member of our staff passes daily. This road is, upon the whole, good, considering everything, but it is disfigured in several places by groups of really dangerous pot-holes, and one would have supposed that, if any work could be done on this road, the pot-holes would first receive attention. But no, the man to whom we have referred has been engaged entirely upon trimming the grass edges of the road!

# TANKS---the Real British A

**T**HE armoured car "Tanks," it is generally conceded, formed the best kept secret of the war. The interest of *The Motor Cycle* in them will be fresh in our readers' minds. It was through our Recruiting Section that the men operating these Tanks were recruited, and the Editor of *The Motor Cycle* was, at the beginning of the year, requested by the War Office to journey about the country examining applicants for this Heavy Armoured Car Section, it being necessary that all should possess practical motoring or technical experience. Accordingly examinations of recruits were held regularly in London, Manchester, Nottingham, Bristol, Coventry, etc. The Army Council subsequently sent to Mr. Geoffrey Smith a letter of "thanks and appreciation for the most patriotic and cordial assistance rendered."

## A Journalistic Scoop.

It was not until September 16th last that the first reference to these heavy armoured cars was made in an official despatch. The sensation that the Tanks created and the success that attended their *début* will be fresh in our readers' minds, and since that time the authorities have been busy doling out credit to the originators of the Tanks—but there are still more claimants to the honour! Americans, for instance, assert that the Tanks were conceived in the States, and that the plans were originally submitted by American manufacturers to the British Government. But the same authority which advances this remarkable statement also illustrates the vehicle which it supposes is the real Tank used by the British Government, and puts forward the edifying information that the caterpillars were made in America and subsequently armoured by the British in this country!

From  
*Popular  
Mechanics.*

AN  
AMERICAN  
DESIGN.

## le and Neutral Impressions.

How the photographs came to be published in one of the illustrated papers last week and to appear simultaneously with a statement by Mr. Lloyd George that it was not in the national interest that pictures of the Tanks should be published just yet is general talk. The fact of one paper being favoured was, it appears, due to that journal having approached the Commander-in-Chief in France, thus leaving the Press Bureau out of reckoning. It is altogether absurd that such a thing could have happened.

### American and Dutch Ideas.

On this page we publish two photographs of the actual all-British Tanks propelled by an internal combustion engine which have already made history and promise to command still more attention in the future. Alongside the official pictures we publish the American journal's version of the British Tank as "conceived in America and armoured by the British authorities," and also a Dutch paper's impression of the Tanks.

When the last picture was reproduced in a Dutch motor contemporary, the editor was quite under the impression that he had got hold of the real thing, and announced the publication of the "first photographs" with a flourish of trumpets. There was a footnote to the article to the effect that, while the paper was being printed, the Dutch war correspondent on the English side, being in Amsterdam, saw the picture and affirmed that it was really one of the war monsters which he saw on the Western Front. An informative "secret" is appended! Let us whisper it! The Tanks were made in America to the order of the English Government, and the first six were despatched to England in August!

A DUTCH  
IDEA OF  
THE TANKS

## THE FLAT TWIN AT THE BAR.

By "IXION."

**I**N our issue of November 2nd I dealt with certain criticisms which have been passed on the flat twin, especially in the larger sizes, and which had recently found expression in a technical article. The main misstatement is tersely phrased by the writer in question as follows: "While the 350 c.c. opposed engine is singularly successful, engines of larger capacity have yet to prove their success." Endeavouring to avoid personalities and side issues as far as possible, I based my correction on a few simple facts, notably that Government services are preferring certain 500 c.c., 1,100 c.c., and 2,300 c.c. flat twins to all other types of engine for important war duties; that these engines are displaying efficiencies which have genuinely surprised technical experts; and that they compare most favourably with rival types in point of durability.

My correction, as might be expected, has provoked a reply—a reply composed largely of abuse and

innuendo. Its reference to the facts on which the correction was based takes the form of a sneer at the purchasing methods of the authorities, and a query as to the alleged power output and wearing factors of the engines concerned.

This reply, however, makes the position perfectly clear. Either I am lying about these engines, or the writer in question is ignorant of their existence and quality. We will leave it at that till the war is over, and these engines are available for public tests and discussion. In the meantime any reader who doubts my honesty will probably realise that the helter-skelter visible in trade circles to get big flat twin models ready for the post-war markets indicates one of two things: either our motor cycle engineers are suffering from temporary insanity, or else the alleged impossibility of producing satisfactory flat twins exceeding 350 c.c. is a myth. It appears to me that this is a point which is easily decided.

## PETROL SUBSTITUTES.

BINKS FUEL.

**D**URING the summer substitutes for petrol were largely in demand, and were used with considerable success by motor cyclists in general. Latterly, however, partly owing to the arrival of winter, partly due to the Petrol Committee having been more generous in its allotments, and to some extent to the difficulty and delay in obtaining deliveries of "substitutes," the fuel question has not been so largely before the public eye.

In connection with the last point, it will be recalled that we recently published a number of letters, representative of a larger number received, complaining of the delay in delivery of fuel ordered from Messrs. C. Binks, Ltd., Eccles, Manchester, and, in the case of one correspondent, also suggesting that this firm was profiteering or taking advantage of war conditions to make unreasonable profits.

Messrs. Binks considered that the publication of such letters was a serious reflection upon their business methods, and suggested that we should send a representative to their works to investigate their system. This we have done, and we briefly state the result.

In most of the cases investigated the delay complained of was due to the fact that the customer had not remitted the full amount in payment of the fuel: the reason for this being that the price of the fuel had advanced between the date of Messrs. Binks's advertisement appearing and the receipt of the customer's cheque.

Messrs. Binks satisfied our investigator that this rapid advance was owing to the conditions under which Messrs. Binks themselves were purchasing supplies, and in this connection it should be borne in mind that some time might elapse between the time of the despatch of Messrs. Binks's advertisement "copy" and the date when the advertisement itself was read by the particular reader concerned.

In other cases delay was due to the fact that Messrs. Binks were depending upon other firms for the despatch of the fuel. The delay was unavoidable in the circumstances, but, as Messrs. Binks's advertisement did not indicate the possibility of such delay, we think that those of our readers who had sent the full amount in payment were fully justified in assuming that their orders would be dealt with promptly by the firm, and therefore they had reasonable cause for complaint. This applies not only to delivery of fuel but also to carburettors.

Messrs. Binks frankly admit that there have been mistakes on their part, and that in some cases delays have occurred in dealing with correspondence, but here we think full allowance should be made for the difficulty in carrying on any

business satisfactorily in these times, because of the shortness of labour, and it should also be recognised that, in the case of Messrs. Binks, this difficulty has been enormously increased by the rapid growth of the firm's business. It is only fair to add that the mistakes and delays which have occurred were not in undue proportion to the very large number of orders which have been dealt with.

Messrs. Binks have now arranged to carry a considerable amount of stock on their own premises, and have also made improvements in their organisation.

We are satisfied that they wish to execute all orders promptly, and have reason to believe that in future customers will have no cause for complaint in this respect, though allowance must be made for the present abnormal conditions under which every business is suffering both as regards staff and transport facilities.

We may add that the financial position of the firm is good, as we have satisfied ourselves that its monetary reserve is ample. This is not merely based on the books of the firm, but has been verified by its bankers.

2½ h.p. EXCELSIOR-J.A.P. LIGHTWEIGHT.

Messrs. Bayliss, Thomas & Co. have produced the above four-stroke lightweight. Footboards are fitted in place of footrests, and a sight feed lubricator is provided. The gear is an Albion two-speed, with hand-controlled clutch.

# AIRCRAFT WORKERS HILL-CLIMB

Passing the timekeepers at speed at the top of the hill.

**Y**ET another hill-climb has been organised by the Royal Aircraft Factory.

It was held on the hill leading to Newlands Corner on Saturday afternoon last. It formed an inter-department competition between E department in which experimental engine work is carried out, and G department which deals with repairs and overhauls. In fact, the affair was the outcome of a challenge between the two sections, viz., the repairs and the experimental department staffs, between whom keen rivalry exists. The organisation devolved largely upon the shoulders of the secretary of the meeting, Mr. W. E. Wickham, who though comparatively a novice at this kind of work, has a natural aptitude for it. The manner in which he gave out the formula results of each event within five minutes of its completion was really quite remarkable. The officials were greatly assisted by a portable telephone which, unlike the majority of these instruments when used at hill-climbs, worked faultlessly through out the afternoon. By its use the starting time was transmitted to the timekeeper, who was stationed on the finishing line. Two Surrey policemen rendered valuable help, one kept the road clear at the start while the other officiated at the top of the hill. All the competing motor cycles bore a number on the front, and, in addition, the riders carried their numbers on the right arm. Odd numbers denoted E department, even numbers G department. In deciding the results first place counted three points, second two points, and third one point.

We arrived at the venue punctually, but the event, which was timed to start at 1.15, did not take place until sixty-five minutes later, as many of the competitors were very late in reaching the foot of the hill. The weather was cold and inclined to be showery, while a strong westerly wind blew across the

course; however, the rain, fortunately, held off. Previous to the start, we met W. F. Guiver, a well-known competition rider in pre-war days. He has been about eighteen months at the R.A.F., and has been in France several times. Having attended two previous R.A.F. events, we naturally became acquainted

**ON THE STARTING LINE.** The foremost rider is T. P. Mears (5 h.p. Ivy). Mears won Event III. for machines of unlimited capacity.

## Aircraft Workers' Hill-climb.—

with the more skilful riders and their machines, and on this occasion we noticed that Davey's fast Norton bore the title "Gott straf." What he meant to strafe he did not state. Was it Deutschland or his rivals? The programme evoked some amusement by stating in event No. VII. that Page's  $2\frac{1}{2}$  h.p. O.K. had a cubic capacity of 993 c.c.

## "No. 13."

One competitor, Barnwell, No. 13, complained bitterly at having been allotted that unlucky number, blaming it for the disaster which befell him in having to take part in the competition with ten broken spokes in his back wheel. Later he tried to reverse his bad luck by carrying his numbers upside down, but the only result was more broken spokes; in fact, so untrue did the wheel become that the brake fouled the belt rim. Once started, the climb was run off smartly, the men being sent off in quick succession, and then sent back to the start promptly at the end of each event. The surface of the hill was in first-class order.

## The Results.

EVENT I. was for motor bicycles fitted with engines of unlimited cubic capacity, the result to be decided on formula.

The two fastest machines appeared to be Mears's Ivy and Davey's Norton. Guiver made a mistake which we should not have expected of him, and changed up too early, thus losing valuable time. Mears started with his clutch, and though his start was made with rather a jerk he got off the mark well. Others elected to be pushed off the line. Result:

	c.c.	Fig. of Merit.	Dept.
1. P. Davey (3½ Norton) ....	490	2130	E
2. E. Manning (3½ Norton) ..	490	2240	G
3. T. P. Mears (5 Ivy) .....	670	2250	E

EVENT II. for motor cycles fitted with engines up to 750 c.c. Guiver this time profited by experience, did not change speed, and improved upon his previous time by 9s. Some delay was caused by the timekeeper's watch failing, but another was produced and the competition proceeded. Result:

	c.c.	Fig. of Merit.	Dept.
1. W. F. Guiver (3½ Ariel) ...	499	1795	E
2. A. Whitty (4½ B.S.A.) ....	549	1960	G
3. E. Perrott (2½ Douglas) ...	349	2160	G

EVENT III. for motor cycles fitted with engines of unlimited cubic capacity, decided on time. Result:

	Time.	Dept.
1. T. P. Mears (5 Ivy) .....	35½ sec.	E
2. J. W. Hinds (5-6 Zenith) ....	36½ sec.	E
3. F. W. Hart (7-9 Indian) .....	37 sec.	G

EVENT IV. for motor cycles fitted with engines up to 500 c.c.

Much interest was evoked by the good ascent of R. Page (O.K. Junior 180 c.c.), who warmed up his little engine for prolonged periods before each event in which he competed. Result:

	c.c.	Fig. of Merit.	Dept.
1. P. Davey (3½ Norton) ....	490	2160	E
2. E. Perrott (2½ Douglas) ...	349	2200	G
3. W. F. Guiver (3½ Ariel) ...	499	2320	E

EVENT V. for motor cycles fitted with engines up to 350 c.c. Result:

	c.c.	Fig. of Merit.	Dept.
1. E. Perrott (2½ Douglas) ...	349	1880	G
2. E. W. Cox (2½ Calthorpe-Jap)	293	2640	E
3. S. J. Garratt (2½ Triumph). .	225	3225	E

EVENT VI. for two-stroke single-cylinder motor cycles.

In this event there were only two competitors, who performed as follows:

	c.c.	Fig. of Merit.	Dept.
1. S. J. Garratt (2½ Triumph). .	225	3220	E
2. G. Slatter (2½ Levis) .....	215	9080	G

It was now late, getting rapidly dark, and the weather became very threatening, so it was decided to cancel Event VII., the slow hill-climb, and finish up with Event VIII. for sidecar combinations with engines of unlimited cubic capacity. Result:

	c.c.	Fig. of Merit.	Dept.
1. W. F. Guiver (3½ Ariel) ...	499	2490	E
2. T. P. Mears (5 Ivy) .....	670	3600	E
3. F. W. Hart (7-9 Indian) ..	993	3650	E

The result of the competitions was that E department won the event, gaining twenty-three points to G department's eleven.

A. Whitty (4½ h.p. B.S.A.), second in Event II. for machines up to 750 c.c. Incidentally, the photograph shows the highly suitable nature of Newlands Corner, near Guildford, for a hill-climbing competition.

W. F. Guiver (3½ h.p. Ariel), winner of Event II. for machines up to 750 c.c., as well as the sidecar class.

The Editor does not hold himself responsible for the opinions of his correspondents.

All letters should be addressed to the Editor, "The Motor Cycle," Hertford Street, Coventry, and must be accompanied by the writer's name and address.

### An Instructive Experiment.

Sir,—I was very much interested in the account of the accidental injection of water into the intake pipe of an oil engine in *The Motor Cycle* of November 2nd. I have been experimenting in this direction for the past four months, with good results.

I intended writing to you later, when I had found out, by road tests and a better appliance than I have at present for conveying the water to engine, what quantity of water used gave the best results, but when I saw this paragraph I thought I would write at once.

At present I am using a large generator with the bottom part taken off. A glass tube is fixed to the drip pipe, with a rubber tube leading from it, to a small copper pipe soldered on the top side of extended air pipe of a B. and B. carburetter.

My engine is a J.A.P. 1912, and I am now able to do with sidecar and passenger a little over ninety miles per gallon (one-third paraffin, two-thirds petrol) on long journeys. Passenger's weight is 9st, driver's 12st.

WILLIAM SCOTT.

### Three Questions for Manufacturers.

Sir,—Having noticed in recent issues of your paper several new and otherwise excellent designs spoilt by embodying some or all of these (to my mind) faults, may I ask why do manufacturers fit (1) the change speed lever on the same side as the throttle, when to effect a neat change it is essential to operate both simultaneously?

(2.) Semi-automatic lubrication. Why not an oil sump and pump which distributes oil under pressure to all parts and keeps the oil in the crank case at the correct level, instead of a sight feed lubricator, which can never be seen owing to the glass being covered with oil?

(3.) Belt drive on a sidecar machine. Considering the improvements made in chain transmissions, I consider this form of drive is equally as smooth as a belt, with the additional attraction that chains require little attention and seldom get out of order in comparison with a belt, which slips when it is wet, stretches, pulls out, breaks, and has to be frequently renewed. A sidecar outfit in 1917 with belt drive!!

E.D.M., R.F.A.

### Vaporisation of Heavy Fuels.

Sir,—I have been a keen motor cyclist for some years now, having ridden most makes of machines. I have taken in your paper since it was first published in 1903, and would not miss it for anything.

On reading through your issue for October 19th (just arrived here) I noticed the vaporiser made by Mr. Reid from a boot polish tin. As early as March, 1913, I fitted a somewhat similar device on my Scott in order to get easy starting on benzole. In my case though I used the hot water from the drain tap at the base of the cylinder (right-hand cylinder), the outlet pipe from the tin also being fitted with a tap. The top of the tin was fitted with a rubber and felt pad and was readily detachable, and held in position with a light spiral spring. To start I simply took off the lid, dropped in a few lumps of carbide, turned on the water tap, and in a few seconds it would be quite warm, and would always start at the first dig of the starter. As soon as it was started I opened first the tap from the tin and let out the gas generated and water residue, then turned on the

tap from the cylinder and flushed the residue out of the tin, and then shut both taps. As soon as the water in the radiator had warmed up I again opened the cylinder tap and thus formed a hot water jacket, which I found greatly assisted the running, especially on the pilot jet (Binks carburetter). With this arrangement I regularly obtained 102 to 105 m.p.g. on pure benzole.

Alexandria.

A REGULAR READER.

### The Scott Sociable.

Sir,—May I add my humble opinion anent the Scott Sociable? The three wheels are apparently a great eyesore to some of your readers; but, to my mind, the criticisms on this point are nothing but the voice of a narrow-minded convention, which seems ever to bar modern progress. Conservatism of this kind will never get us anywhere.

Do we buy motors for ornament? No; we buy them for travel. What then matters appearance? Moreover, why should we call that "ugly" which is merely unconventional? Let us rather educate ourselves to appreciate a new departure, and judge it from an unbiassed standpoint when we have sampled its abilities as a motor, and not prematurely from its appearance, which is surely the least important of all a motor's points.

If, in days to come, we find the sociable to be powerful and flexible, reliable, accessible, clean, and weatherproof, what practical man among us will be puerile enough to ask for a fourth and unnecessary wheel—an extra tyre to wear, extra weight, and friction to reduce speed and increase the fuel bill, and extra tax to pay?

Let us remember that the Scott motor cycle did not please our conventional minds in 1908 and 1909, but that we have had to raise our hats to it since then in the Isle of Man. Moreover, I think most of us who have ridden one of these machines are anticipating "some luxury" when the new sociable arrives.

Usual disclaimer, please.

JUSTICE.

Limerick.

### A Compression-operating Device.

Sir,—We notice with interest on page 418 of your issue of the 9th November an illustrated description of an oiling device which has apparently been patented by Mr. D. MacGregor, of 49, Sampson Road, Sparkbrook.

We append herewith a drawing of a device which we designed and made in conjunction with Mr. W. G. Aston at this address some four years ago.

We think your readers will be impressed by the coincidence that the making of the device we illustrate was entrusted to a mechanic named D. MacGregor, who was at that time in our employ.

THE SPHINX MANUFACTURING CO.

A mechanical pump made four years ago.

### Colonial Built Engine.

Sir,—In your issue of the 19th ult. your correspondent quotes an engine built by Mr. F. D. Johnson, of Perth (Australia), as the first motor cycle engine built in the Commonwealth.

This is entirely incorrect, as I can quote several instances of locally built engines which have been on the market several years, one of which is the Mona, the whole machine being manufactured in the factory of Messrs. Quirk and Co., of Melbourne. The engine is  $3\frac{1}{2}$  h.p., horizontally opposed.

The engine illustrated seems to be almost identical with the American Pope machine.

JAMES P. STEWART.

### Further Trials of Substitutes and Paraffin.

Sir,—I have further experimented with different fuels, and since my letter that appeared in your issue of October 19th I have covered several hundred miles. On October 14th, for example, I ran ninety miles in 3h. 20m. on pure "white spirit," American Oil Co.'s (Pratt's), from Oxford to Cambridge. The last twenty miles to Cambridge at an average of 30 m.p.h. No overheating.

On October 15th I fitted an auxiliary pure petrol tank, connected to main supply, for starting purposes. The advantages gained are obvious.

On October 16th or 17th I fitted a Morgan vaporiser in the usual manner, only that both petrol and substitute pipes connect to inlet of vaporiser, which gives better results.

The fuel pipe, inlet pipe, and carburetter are lagged with asbestos string and insulation tape, further strengthened with fine copper wire to prevent fuel loosening insulation tape. This is necessary to keep in the heat.

I proceed in usual manner, turning on substitute when engine is warm. The vaporiser makes the substitute more or less like petrol, and is quite a necessity. I find that pure white paraffin (the Mex at 1s. 1d. a gallon) works well, but knocks badly on opening throttle, and picks up badly. However, with 25% petrol added, it makes a fuel as good as petrol nearly (because of the Morgan vaporiser). This paraffin at 1s. 1d. and petrol works out cheaper than substitute, viz., 1s. 6d. per gallon. Whereas petrol substitutes are, Petrofin 2s. and Pratt's white spirit 2s. 6d. a gallon, naturally, when one is short of petrol, pure substitute must be used.

I am not yet in a position to say which fuel is the better with the Morgan vaporiser (substitute or paraffin-petrol). I think perhaps the substitute is the better on the whole, as it uses less petrol. I notice, however, that less air is taken with the vaporiser, less pinking and knocking, cooler engine, and more power on hills, etc.

One thing further, with the vaporiser acceleration and picking up are slow on pure paraffin, and knocking occurs. This is less on pure substitute. On paraffin and petrol (75% and 25%) it is almost nil.

Since I wrote last I have been several hundred miles. I have had the engine down and decarbonised it. The carbon was quite soft, and easy to get off. The valves were hardly pitted at all. Rather much side play in bearings, but no vertical play.

If I run the carburetter dry of substitute before stopping (with vaporiser), a huge suction is created, causing leaks at taps and joints. So I turn on the pure petrol about 250 yards from my stopping place, and turn off substitute, to be ready for starting up again on pure petrol.

J. H. LAWSON WALTON, Lt., 13 K.R.R., att. R.F.C.

### The Flat Twin at the Bar.

Sir,—May I be permitted to say a few words on this interesting discussion. I think it is generally admitted that all future designs will be on the lines of increased efficiency, that is, the maximum power out of the minimum engine capacity. Now let us see how the "flat" twin compares with its rivals, the single and the V twin. In order to obtain this high power output it is necessary to run the engine at a very high speed; well, Bailey's Douglas attained 5,400 r.p.m. on the track, and a  $2\frac{1}{2}$  A.B.C. 5,500 on the road (37 m.p.h. on an 11 to 1 gear). The fastest singles I know of are the  $2\frac{3}{4}$  A.J.S., the winner of the last T.T., and the experimental long-stroke Levis, which did close on 5,000 r.p.m. O'Donovan's Norton attained 4,100 r.p.m. on the track. Here, at any rate, the "flat twin" scores over its rivals, as the V twin has probably never done more than

3,500 r.p.m. But it is impossible to run an engine at such high speeds without causing awful wear, unless it is well balanced. The "flat" twin has a good even firing interval, and almost perfect mechanical balance; the thumping single has a fair firing interval but a hopeless balance; the V twin has an uneven firing interval, and a moderate balance. Thus for our efficient design the flat twin fills the bill perfectly; the others nowhere nearly approach it. Still, even high efficiency is not everything; wear and economy are also important. The vibration of a flat twin is negligible. I have seen many such an engine "revved" all out on the stand with hardly a tremor; the single and V twin would nearly shake themselves to bits under such conditions. Obviously, then, the smooth even firing and perfect balance of the flat twin must cause far less wear than the awful jerkiness and vibration apparent on the other machines running at half its speed. After all, it is not "revving" which hurts an engine—it is the "kick, kick, kick," of the single-cylinder thumper, and the vibration of both it and the V twin which does the damage. As to economy, there is no reason to suppose that either of the twins would differ in this respect, but personally I think that a single is always a little more economical than any twin. Still, the "flat" twin would more than even this up by its saving in chains, belts, and tyres, owing to its even drive. Now let us come to practice. The Indian V twin and the Norton single hold the world's speed records. Why is this? Well, the former belongs to a class only occupied by the V twin type, and the latter is merely the result of what a wonderfully clever driver and tuner up of a really fine crack machine can do, and is merely the exception which proves the rule. The peak of the power curve of the most efficient racing engine known (the 10 h.p. Calthorpe racer) is only 3,750 r.p.m., so if a single can do over that speed it can develop the maximum power possible. When it is possible to design an engine with a power curve peak higher than the maximum engine speed obtainable on a single (and a V twin is inferior in that respect), then, indeed, the "flat" twin will be indisputably unapproachable, as it now is in all other respects. This also is the cause of the Norton victory. There is nothing technically wrong with the flat twin; could this ever be even suggested for its rivals? Personally, I think the 71 m.p.h. solo and 53 with sidecar and passenger of a  $2\frac{3}{4}$  h.p. Douglas equally as fine a performance. In the 350 c.c. class the Douglas has already swept the V twin and single practically off the market, as witness the disappearance of the  $2\frac{3}{4}$  V twin Humber, and the  $2\frac{3}{4}$  A.J.S. single, both Junior T.T. winners. Soon the A.B.C. and other  $3\frac{1}{2}$  flat twins will dominate the 500 c.c. and other classes in the same manner. After all is said and done, it was Douglas who introduced an entirely new design of engine, which, in the teeth of the competition of the singles, made by firms with a splendid pedal cycle reputation behind them, forced itself by sheer merit into the position it holds to-day of being the most popular machine on the road. Here, indeed, we have a firm winning through solely on the superiority of the design of its productions. Had the flat twin not been infinitely superior to its rivals this could never have been possible. No, however good the results obtained on a type of machine which, though fundamentally bad in design, has nevertheless been designed and tuned up by an expert, it cannot be denied that of all engines, the one most perfect in design is "the flat twin."

### Petrol Substitutes.

Sir,—My experiences with two petrol substitutes may be of interest to your readers. During the last fortnight I have experimented with "Benzolite" and "Kempol," and find the results almost identical, although one of the compounds is obviously much more largely a paraffin mixture than the other. My experience is that I can run on either pure by using a petrol injection to start, I have to retard my spark for comparatively slight hills owing to knocking developing, and have to change down rather earlier on stiff climbs. The consumption is such that I get about five or six miles less per gallon than on petrol, with which I reckon to get sixty miles per gallon. The machine is a  $3\frac{1}{2}$  h.p. single-cylinder with heavy coach-built sidecar, and I use a B. and B. carburetter, to which I made no alteration. My machine is four years old, and my brother on a five-year-old Douglas is getting similar results.

Newcastle-on-Tyne.

J.N.B.

# New Hudson

## STRENGTH! POWER! PERFORMANCE!

Strength that endures—Power for every demand—in Performance unfailing—these are the chief attributes of The New Hudson Big Six. Trustworthy and Dependable, it represents the highest development of Motor Cycle construction.

Renowned for hill-climbing—no road too rough—no hill too steep. Our illustration depicts a New Hudson Big Six combination roaring up a hill, the chief characteristics of which are its loose, rough surface and its steep gradient (1 to 4).

**THE NEW HUDSON CYCLE CO., LTD.,** Parade Mills, **BIRMINGHAM.**

LONDON: 45, Gray's Inn Road.

# MISCELLANEOUS ADVERTISEMENTS.

## PRICES.

**ADVERTISEMENTS** in these columns—First 12 words or less 1/6, and 3d. for every two words after. Each paragraph is charged separately. Name and address must be counted. Series discounts and special terms to regular trade advertisers will be quoted on application.

Postal Orders sent in payment for advertisements should be made payable to **ILIFFE & SONS Ltd.**, and crossed **& Co.**

All advertisements in this section should be accompanied with remittance, and be addressed to the offices of "The Motor Cycle," Hertford Street, Coventry. To ensure insertion letters should be posted in time to reach the offices of "The Motor Cycle," Coventry, or London (20, Tudor St., E.C.), by the first post on Friday morning previous to the day of issue.

All letters relating to advertisements should quote the number which is printed at the end of each advertisement, and the date of the issue in which it appeared.

The proprietors are not responsible for clerical or printers' errors, although every care is taken to avoid mistakes.

## NUMBERED ADDRESSES.

For the convenience of advertisers, letters may be addressed to numbers at "The Motor Cycle" Office. When this is desired, the sum of 6d. to defray the cost of registration and to cover postage on replies must be added to the advertisement charge. Only the number will appear in the advertisement. All replies should be addressed, "No. 000, c/o 'The Motor Cycle,' 20, Tudor Street, E.C."

## DEPOSIT SYSTEM.

Persons who hesitate to send money to unknown persons may deal in perfect safety by availing themselves of our Deposit System. If the money be deposited with "The Motor Cycle," both parties are advised of this receipt.

The time allowed for a decision after receipt of the goods is three days, and if a sale is effected we remit the amount to the seller, but if not we return the amount to the depositor, and each party to the transaction pays carriage one way. For all transactions exceeding £10 in value, a deposit fee of 2s. 6d. is charged, when under £10 the fee is 1s. All deposit matters are dealt with at Coventry, and cheques and money orders should be made payable to Iliffe & Sons Limited.

The letter "D" at the end of an advertisement is an indication that the advertiser is willing to avail himself of the Deposit System. Other advertisers may be equally desirous, but have not advised us to that effect.

## SPECIAL NOTE.

Readers who reply to advertisements and receive no answer to their enquiries are requested to regard the silence as an indication that the goods advertised have already been disposed of. Advertisers often receive so many enquiries that it is quite impossible to reply to each one by post.

## DEFENCE OF THE REALM ACT

Under the provisions of the above Act, advertisers requiring workmen, and whose business consists wholly or mainly of engineering or the productions of munitions of war, or substances required for the production thereof, and whose works are situated within 30 miles of London, must include in every such advertisement the words, "No person resident more than 10 miles away, or already engaged on Government work, will be engaged."

Advertisers whose works are situated more than 30 miles from London can only have their announcements inserted with the approval of the Board of Trade, who will allocate to each advertisement a box number, and collect and distribute to the advertiser all replies received. The necessary forms of application can be obtained from any Labour Exchange or from the offices of this paper, and each advertisement must contain a clear reference to the effect that no person already engaged on Government work need apply.

## WHILST

## There is Yet Time.

The Ministry of Munitions have issued an order prohibiting the manufacture of Motor Cycles for private use after Nov. 15th, 1916. It therefore behoves every intending purchaser to place his order immediately, as the stock of motor cycles on hand is quite inadequate for all requirements.

We have decided to deal with orders strictly in the rotation in which they are received, and in cases where immediate delivery is not desired, we will put aside any machine upon which a deposit is paid. Communicate with us without delay, and secure your new machine whilst there is yet time.

## NEW MODELS FROM STOCK.

**Manufacture Under Permit.**

**S**INCE the issue of the Order by the Minister of Munitions prohibiting the manufacture of new motor vehicles unless armed with a permit, we have kept readers acquainted with the position from the manufacturers' point of view. Our enquiries of the past week show that, in the majority of cases, firms have been given a temporary permit of fourteen days' duration, this being, apparently, the plan of the particular committee controlling motor permits until its investigations are complete. After particulars have been sent in by the different firms still engaged on motor manufacture, inspections are held by officers appointed by the committee to confirm the statements made.

Already certain firms have received permission to carry on, the Government officials having satisfied themselves that the resources of the works, apart from the output of munitions where possible are being used to the best advantage in the national interest. So far from the Ministry of Munitions Order having thrown works into chaos, we have heard it stated on more than one hand by managers of firms that they are better off under the permit system than formerly. In addition to producing what munitions they can, they are materially assisting our exchange by concentrating their much-reduced motor cycle departments on Overseas trade, and, more important still, the two types of work are being performed with the cognisance of the authorities. We have already pointed out that many firms have thousands of pounds worth of complete stock on hand, which it would be serious to allow to stand aside depreciating in value, when, by the minimum amount of labour, they could be assembled and turned into gold. Whether the conditions may alter later so as to preclude even the smallest amount of labour being diverted from munitions no one can say definitely, but it is to be hoped that such a state of affairs may not be reached, both in the national interest and also from the

point of view of the British motor trade, which before the war held such an elevated position in the world's markets, but now severely crippled by the war. Even so, should a still greater effort be proved to be needed, the motor industry, which has already proved of inestimable value to the Government in its ready adaptation to the production of special engineering work, is patriotic to the core, and will readily put everything aside to concentrate the whole of its energies on war work.

Meanwhile it may be well to reassure those firms sorely tried by the new Order that the Government are not obstructionists, and recognise, as clearly as other business men, the paramount need of maintaining our exports as far as possible, and also of studying the national interests in regard to important established industries. As the work of the Permit Committee is growing, any firms who have applied for a permit and have not yet received any reply may reasonably carry on until their case has been considered.

**Sidecar Machine Guns for Cadets.**

**N**O doubt the excellent work rendered Overseas by the sidecar machine gun outfits which form the equipment of the Motor Machine Gun Service, has led the authorities to approve the formation of motor machine guns in connection with Cadet Corps. Henceforward the operation of machine guns and their rapid concentration at most favourable points by means of the mobile motor cycle and sidecar will form part of their training, and the youths are looking forward to the latest departure with no small amount of enthusiasm. Whilst the War Office has approved the formation and equipment, it is unable at present to provide the machines necessary, so that the officers commanding the unit are making an appeal for the motor cycles and sidecar chassis necessary. Good luck to this new official recognition of the handiness and good qualities of the sidecar.

### An Active Service Hint.

A D.R. gravely informs me that when the little end bush of his engine gave out, he made a new one out of a Hun shell fuse, and successfully covered 500 miles on it.

### More Imagination, Please!

Why is it that your brilliant engineer so seldom possesses the necessary imagination to render his work ideal from a user's standpoint? If he plans a car engine it is usually perfectly accessible when it is lying on the bench, but requires a spanner incorporating eight universal joints and a lazytongs handle when it is installed in the chassis. If he designs a powerful twin he forgets (a) that it will probably be used with a sidecar, and (b) on which side the sidecar will go. As a consequence he mounts such items as the oil and petrol fillers and the carburetter on the sidecar flank. By means of long swan-necked funnels one may succeed in replenishing the tanks, but only a professional contortionist can handle the carburetter details comfortably unless the sidecar is first removed, and some of the best modern sidecars are as good as brazed up solid with the cycle frame. I know the modern craze is all for short inlet pipes and straight through carburetters with their communication trenches opening amidships; but most users would sacrifice a fraction of efficiency for an off-side carburetter with a top inlet, like the Longuemare-Hardy; and the excellent functioning of my Claudel vaporiser shows that a hot air supply will atone for many parasangs of inlet piping.

Natives of India interested in the photographer and the rider of a Baby Triumph. The beautiful palms will convey an idea of the climate of Madras, where the sender of the picture—Mr. Douglas Burch—resides.

### Sprung Sidecar Wheels.

It will be interesting to see whether the long tale of broken sidecar tubes in Six Day trials ceases when the sprung sidecar wheel is standardised. This sprung side wheel has been long in coming, chiefly because the chair could be sprung separately from the chassis, and the spring of the chair was not hampered by any dread of lateral sway. Consequently it proved a simple matter to spring the passenger so that he or she rode more comfortably than on most big cars, the designer having nothing but efficient springing to consider, and knowing practically the exact weight for which to provide, instead of having to compromise between extremes represented by one passenger, and by five passengers and luggage, as the car engineer must do. As soon as the passenger was comfortable, sidecar springing was rashly regarded as perfect, and nothing more was attempted, until engines and gears improved so much that the outfits began to be entered for big trials. Then we got large crops of broken frames. Even thus makers coquetted for a time with heavier tubing, girder trusses, and the substitution of mechanical designs with straight tubes for the old bent-up-anyhow affairs. Finally it has dawned on a few bright spirits that tubes are bound to fatigue when they are trussed rigidly tense, and then subjected to an eternal succession of very heavy shocks; and so the sprung side wheel as favoured by Millford and Gloria is appearing on heavy outfits, and our sidecar chassis should gradually cease to fracture. I am speaking here, of course, with an eye to the hard rider's machine. A potterer's sidecar, performing its mileage on easy roads, does not fracture very quickly; but set a driver to average legal limit over bad roads, and to lug his outfit round forty or fifty fierce hairpins in a week—then his frame and wheels will bear rapid testimony to their structural weaknesses. I notice that the War Office is beginning to realise the merits of the more modern sidecar chassis.

### Fact v. Fancy.

If critics were content to say that the bigger flat twins available for the public do not yet evince the same power of tackling heavy jobs on high gears which the best singles possess, I should not complain; for this allegation is true so far as my own wide and varied experience of such engines goes, and *pace* "CP450" these experiences afford a pretty solid basis for convictions. I have owned a couple of 4 h.p. Douglas machines, both of which were worked hard for twelve months, and my present A.B.C. has been in use for a longer period than that, and has probably covered seven or eight thousand miles. I think this interesting discussion is being weakened by two misconceptions, which are closely connected. The first

**Occasional Comments.—**

is the prevalent idea that a modern designer can get the best out of a new pattern or size of engine in three months work; the second is that "Road Rider" and myself pretend that the 500 c.c. twin is already—*hic et nunc*—ineffably and on all scores immensely the superior of the single cylinder, and of all rival types of engine. The first point requires a paragraph to itself, the second is an exaggeration; we both already prefer the existing flat twins to other types of engine at present on the market, and we both think that the superiority which we claim for it will increase rapidly as the possibilities of the type are better comprehended and developed.

**The Evolution of an Engine.**

In the ancient myth Pallas Athene leapt fully armed from the brain of Jove; and "CP450" has a similar explanation of the 350 c.c. Douglas, saying that the substitution of mechanical for automatic valves in 1912 is the only radical innovation it has undergone. I saw the prototypes of this engine years before it astonished the riding world in an ever-memorable End-to-end trial, and though I am not too familiar with its commercial history, I believe at least two firms absolutely failed to make anything of it before the Douglas Co. adopted it, and succeeded. A parallel example from the machine which "CP450" prefers—the Rudge—is germane here. The Rudge people made a great success of the "square" single-cylinder, and a few years ago they introduced a special 5-6 h.p. long-stroke 750 c.c. single, the early models of which were monsters of vibration. A rash judge, drawing premature deductions, might then have asserted that a long-stroke single-cylinder was an impossible monstrosity for inherent technical reasons, and he might have plumed himself on his acumen until he met, for example, the famous long-stroke Norton. The simple fact of the matter is that the designing of petrol engines is still but partially understood; an engineer takes a successful, even a brilliant, engine, and produces a fresh model, diversified by perhaps a single new factor, even a factor so simple as additional capacity; and he is mortified to discover that the new engine is disappointing. To quote another example, some clever makers made up their minds that if they could produce an engine which would set up records on the Brooklands test hill, that engine would win most of the competitions for them. They got their record, and found it impossible to adapt the engine either for speed on the flat, or even for ordinary touring purposes; they scrapped the entire design, and began all over again. Or again, two years ago I owned a 500 c.c. flat twin, which in the way of gear holding up hills was as good as the ordinary 500 c.c. single; and its designer, in trying to incorporate other much needed merits, has lost this quality. Perhaps next year he will manage to combine the lot. To sum up, many flat twins of the larger size are in the position occupied by the 350 c.c. flat twin before the Douglas people metamorphosed it, or the big 750 singles in their earlier days; they constitute a new-type of engine, and their detail design is not thoroughly mastered. They suffer from juvenility in some of their aspects, and in particular they rely overmuch on their gear boxes. But as they can already boast a better balance than any motor cycle engine except the four-cylinder, and as they

further develop quite as high an efficiency as the oldest and best understood types, it is hardly risky to prophesy that in the very near future they will embody all that is best in the singles and V twins, plus an excellence of balance which no previous type has ever attained or can hope to equal at any time.

**An Unfair Comparison.**

Another fallacy is being permitted to cloud our discussions. A number of correspondents actually contrast the road performances of T.T. singles with those of the bulky touring flat twins, replete with kick-starters, three and four speed gears, double springing, and other fittings which these speed merchants would not dream of employing in their road-burning work. "CP450," for example, calmly pits the Brooklands Special Norton against the tourist A.B.C., and even draws a price comparison. His other comparison with a belt-driven Rudge, geared  $5\frac{1}{2}$  to 1 on bottom, is hardly less unfair, seeing that his Rudge, good hill-climber as it is, could not face anything very stiff on such a gear, and is really a road racer, whereas his flat twin could clamber up precipices, and, though a go-anywhere mount, could hold its own tolerably well with the Rudge as a fast mount on the flat (he is, by the way, perfectly right in supposing that the later A.B.C. is perceptibly superior to his old model). Comparisons with T.T. singles ought surely to be drawn against flat twins of a similar type, e.g., the "H.T.T." model Brough or the "C" model A.B.C. The latter machine is one of which very few people have any experience, nor can they taste its paces till after the war. It scales 150 lb. ready for the road, has a two-speed gear with foot change, and can get nearly 80 m.p.h. In other words, it can cut out work for the fastest single ever made. I do not know whether there is any other T.T. special flat twin of the 500 c.c. size in existence; though I have heard rumours of a very fast road racing Brough, I never met it; and I suppose the scarcity of such models explains the calm humour with which correspondents pit machines which ought to be classed with such heavy go-anywhere mounts as a W.D. Triumph against stripped road racing specials.

THE RECOGNISED POSE FOR ARMY MOTOR CYCLISTS.

"Ten up" on a  $3\frac{1}{2}$  h.p. B.S.A. motor cycle. Cpl. Eaton, 58th Division, S.C.R.E., who sends us the photograph, does not state the speed he attained with his merry men aboard.

## THE CARE OF HUB GEARS.

Some General Hints on the Management of Change-speed Hub Gears.

**A**LTHOUGH the countershaft gear is the most popular form of change speed to-day, particularly for sidecar combinations, there still remain a large number of motor cycles in use which are fitted with three-speed hub gears, of which the best known, of course, are the Armstrong and Sturmev-Archer. These hub gears are perfectly satisfactory when the correct model is selected to suit the power of the engine, but, like any other piece of mechanism, they pay for a little attention, and if neglected they are likely to give trouble.

### Maintenance and Care.

Dealing first with the Armstrong, which is the oldest of these hub gears on motor cycles. First and foremost, the rider must not forget to lubricate the gear freely about every hundred miles with *thin* oil, not thick engine oil, and *on no account grease* (this attention is, of course, necessary in the case of all types and makes), while he must also pay particular attention to the tightness of the nuts securing the control to the frame and the axle to the back forks of the machine. Any lack of rigidity between that part of the frame to which the control is attached and the rear forks of the machine may prevent the gear wheels coming properly into mesh, with the result that a breakage occurs, the chipped portion of the teeth gets between the other gear wheels, and trouble at once arises.

Many breakages in gear teeth are due to the spring in the control rod not being sufficiently strong. The spring referred to is that marked with an arrow in fig. 1. If this spring is weak it simply gives, and cannot overcome the pressure of the spring in the horizontal spindle which is shown in the illustration. This second spring serves to push the pinions into mesh, and, unless sufficient pressure is exerted upon it, the teeth will not wholly engage. Very much the same

Fig. 1.—A weak spring in control rod may cause breakages in the gear teeth.

effect can be obtained by the control not being tightly fixed to the frame. See fig. 2. The rider has to make sure that the nut on the spindle on which the change-speed lever works is tight, and also that the small grub screw which secures the clip on to the top tube enters a hole in the frame. To secure the clip to the frame by frictional pressure is not enough. Sometimes in cases when the gears are badly fitted the clip is merely a frictional fit, and the screw is omitted; in such cases the nuts are bound to work loose in time, the whole bracket moves along the

frame tube, and trouble ensues because the control no longer allows the pinions to mesh properly.

Referring again to fig. 1. The clip in which the bell crank lever works should be screwed well along the spindle, so that there is enough movement for the crank to work, but not too much. Many people screw the clip and adjusting nut only a few threads along the spindle, with the result that insufficient pressure is placed upon the small push rod inside the hollow spindle.

The gear should never be run with any side shake in the belt rim, and any slackness should be taken up by adjusting the cone on the chain wheel side; if the rim is allowed to run slack the driver attached to the belt rim is likely to get broken.

Fig. 2.—See that the gear control is fixed tightly to the frame.

To adjust the gear engage the clutch and put the change-speed lever in the free position, unscrew the lock nut at the end of the control rod, and turn the adjusting sleeve until the free or neutral position is found by rotating the back wheel by hand. This will be found by revolving the wheel and gradually moving the adjusting sleeve on control rod until wheel revolves quite freely. A slight noise will be heard from the pinions, but only what arises from the wheels rolling round: there must not on any account be a harsh grating sound.

### Parts which can be Dismantled.

There is not very much that the average amateur can do to a gear of this kind in the case of internal trouble; in fact, in the case of both gears, he will find that even with the instructions given to him he can proceed to a certain stage and will then have to cease work for lack of special tools. The only advantage that can be gained by dismantling a complex gear is to find the source of the trouble. If such a thing as a broken pinion is discovered there is nothing to be done but to send the gear away to a firm of specialists, or to the manufacturers. By dismantling a gear a rider may possibly be able to send away a smaller part, which will cost him less in postage or carriage by rail than if the whole wheel were sent complete.

**The Care of Hub Gears.—**

With regard to the Armstrong gear, which is the more complicated of the two, the rider should start to dismount from the free wheel end, and remove the star washer and cone. The kick-starter free wheel is now free, and the balls which are exposed may be taken out. The wheel should then be turned over and the

spindle firmly fixed between lead clamps in a vice, and a similar star piece and also a cone removed, allowing access to another row of balls (see fig. 4). The belt rim and driver may now be removed. See that the cone has the projection, which serves to prevent it from turning, intact. Next the hub

Fig. 3.—Method of removing hub end ring. Remember it is a left-handed thread.

end ring, which is a left-hand thread, should be removed by means of a hammer and punch (see fig. 3). In the case of a gear which we saw dismantled by the County Cycle and Engineering Co., 64, Staines Road, Hounslow, the ball holder was missing, and all the balls had dropped into the gear. This ball holder is a driving fit.

The motor cyclist has now reached the stage beyond which it is inadvisable to attempt to proceed further without special tools, which are not in the possession of the average amateur. With the aid of these latter the makers or specialists can remove the pawl cage, and finally the clutch, which has to be separately dismantled. It will be seen, therefore, that unless the motor cyclist is an amateur with exceptional skill and can make for himself or obtain from the makers the necessary tools he cannot get very far beyond the dismantling process which enables him to examine for broken parts with this type of gear.

**The Sturmey-Archer Gear.**

With the Sturmey-Archer, however, he can proceed a little further. This gear is much simpler in construction, and up to a certain stage the dismantling is rather easier. As in the case of the Armstrong, the spindle should be held in a vice, and operations should be begun at the free wheel end. The cone should be removed and then the balls, as shown in fig. 4. The chain wheel may now be lifted off, and also the pawl ring with which the free wheel engages. Another cone, cup, and balls are now exposed, and should be unscrewed with a hammer and a punch. This cone has a right-hand thread. Next the wheel

Fig. 4.—The cone removed from free-wheel end, showing the balls.

should be turned over, refastened in the vice, and the ring, similar to that on the Armstrong, shown in the left-hand drawing of fig. 5, should be removed by means of a punch. This has a left-hand thread. When this is done the whole gear may be lifted out, leaving the clutch in the hub. When this stage has been reached the clutch can be examined, and fresh clutch plates can be added if necessary, also any defects that may have developed in the outer shell should be visible. This is about as far as the amateur can go with this type of gear. Even removing the belt rim is a fairly difficult operation, which is quite beyond the skill of the average amateur rider-mechanic.

**Difference between the Various Types.**

Some further interesting facts about the gears are here appended.

**ARMSTRONG.**

The earliest types were Mark II. and Mark III., which latter had rather more clutch plates.

Marks V. and VI. had a still further improved clutch.

Mark VII. a larger clutch.

The T.T. type no clutch and a larger sun pinion.

Fig. 5.—IMPORTANT. On depressing the spring and removing the key A, the whole gear will come to pieces.

As regards the number of balls in all ball races, when fitting new balls or checking the old ones, a sufficient number of balls to fill the race completely should be inserted in every case, and afterwards one ball should be removed.

The following are the various sizes of balls fitted to different parts of the Armstrong hubs.

Marks VI. and VII., belt rim side:

Outside cone,  $\frac{5}{16}$  in.

Round driver,  $\frac{1}{4}$  in.

Inside of driver support,  $\frac{3}{16}$  in.

Other side:

One row,  $\frac{5}{16}$  in.

Underneath clutch body,  $\frac{3}{16}$  in.

Clutch fork,  $\frac{1}{4}$  in.

Marks II., III., and IV., same as above, except  $\frac{5}{16}$  in. on driver support instead of  $\frac{3}{16}$  in., and a  $\frac{1}{4}$  in. under clutch body.

**STURMEY-ARCHER.**

The sizes of balls in this hub are:

J.S. type, belt rim side.

Outer cone,  $\frac{5}{16}$  in.

Round driver,  $\frac{5}{16}$  in.

Inside driver, working on internal clutch cone,  $\frac{1}{4}$  in.

In clutch round central ball ring,  $\frac{1}{4}$  in.

Clutch thrust cone,  $\frac{1}{4}$  in.

Underneath free wheel,  $\frac{5}{16}$  in.

### A Further Selection of Letters from Readers scattered all over the World.

**O**BSERVATIONS of general interest are embodied in the selection of letters appended from Overseas readers. They come from all sorts of out-of-the-way places, and the views expressed are a reflex of our month's correspondence. We repeat our invitation to other motor cyclist readers scattered all over the world to take part in this round table conference of motor cyclists in the different hemispheres. It is by such comparison of views and experiences that the motor cycle will become a perfected mount, and our incomparable sport rendered still more pleasurable.

Owing to the unpleasant attentions of German submarines of late, it is highly probable that there have been letters to us among the lost mails, consequently any reader who finds his letter not published and unanswered would do well to duplicate any communication sent to us.

#### The Munitions Order.

Regular readers will have noticed that, since the last instalment of Overseas letters was published, an Order by the Minister of Munitions prohibits the manufacture of motor vehicles in future without a permit. At first this Order was interpreted by firms generally to mean that the production of new vehicles was to cease entirely, but such is not the case. The Government is desirous of knowing just how much motor work is proceeding, and is furthermore desirous of avoiding any hindrance to the output of the very necessary munitions of war. Where it can be shown that new motor cycles can be built up from parts in stock, and that munitions will in no way be affected, permits will be granted freely. It will clear the air if we remark that the British Government is just as convinced of the desirability of maintaining Overseas connections and specialising on export trade as it has been all along, and it may be taken that the effect of the new Order will, where shipping permits, mean an increase in the number of machines sent Overseas.

We publish below a few letters received from motor cyclists Overseas during the past month:

#### Road Conditions in South Africa.

A South African reader says: "Out here powerful machines are really needed, and we are therefore not keen on the baby two-strokes and other lightweights. Most riders want at least  $3\frac{1}{2}$  h.p., and prefer  $4\frac{1}{4}$  h.p. and even 5 and 6 h.p. for solo work, while 7 h.p. is none too much for sidecar work, as we get gradients as steep as 1 in  $4\frac{1}{2}$ . Spring frames would greatly improve many machines for use in South Africa."

MR. J. W. SHOEBOOTHAM, East Griqualand, South Africa: "The conditions here are very different from those existing at home in England, where there are garages every few

miles. Here they are few and far between, and one has to tackle repairs and overhauls oneself, so that manufacturers should endeavour to produce a strong machine that will withstand these rough roads. At the present moment the roads are one mass of dust, especially on the through postal route from the Colony to Natal. There are large holes filled with loose sand and dust, and only personal experience of the roads enables one to steer clear of them. We have not had a drop of rain for three months, and only .11in. during the last sixteen weeks, so you may perhaps imagine what the dust storms have been like. When the rain eventually comes we shall have to pilot our machines through a sea of mud."

#### Watersplashes and Belt Drive.

STAFF-SGT. C. R. TURNER, Barrachpore, India: "I have been ten years in India, and have been motor cycling since 1911. I have always favoured Triumphs, and I must say for solo riding I have found them very good. The belt drive is a bit of a nuisance in wet weather, and the road I used often to cover from Rawal Pindi to Abbottabad was full of watersplashes. On the Murree-Kashmir road both I and a Clyno were unable to proceed owing to snow nine feet deep. . . . The worst of this part is that the only hills are canal bridges."

#### An Australian's Opinion of the Scott Sociable.

MR. C. G. SOWELL, Guildford, Australia: "It is with great interest that I have read your description of the new Scott cycle car in the issue of *The Motor Cycle* dated July 27th, and I regard your laudatory leader thereon as a hall mark to a good thing. I have been an enthusiastic cycle car experimentalist for the past five years, although, unfortunately, most of my designs have remained on paper for lack of funds and proper appliances. However, my latest tryout is similar to Mr. Scott's idea. I have had the design in my head for the past two years, and I commenced the construction some ten months ago. I felt I had hit the right nail at last, and I am in agreement with your comment that this design will become the true cycle car. Moreover, such a vehicle with a big firm behind it will find a fair-sized fortune

An Australian reader's home-built cycle car evolved from the remains of an old car. (See Mr. C. G. Sowell's letter.)

in Australia alone. Incidentally, if big manufacturers properly realised the prospective size of the motor cycle market in this country if properly catered for, they would establish branch depots without delay at the termination of the war. "Referring again to my cycle car, I might mention that it is partly constructed from an old car, including the 700 x 85 mm. artillery wheels, all three of which are sprung independently of each other, different types of springs being also fitted to each according to the varying conditions of

**Overseas Opinions.—**

working. When completed it will have spring upholstery, and the gear is of the Gradua type, the countershaft being attached to the engine, which will pivot in order to take up the slack in the Whittle belt. The body has room for two passengers on the seat and a child in front, and is so arranged that it cannot sag down at the unsupported front corner. The wheelbase is 4ft. 9in.; track 3ft. 4in. The weight will not exceed 350 lb. unladen."

**Petrol Pipe Unions—a Useful Tip.**

MR. L. W. J. DEUSS, Fort Johnston, Nyasaland: "Who has not had trouble from his petrol pipe parting company at the union? Sooner or later almost everybody is sure to experience it, so the following tip may be welcome:

"Cut a small strip of tin about  $\frac{3}{8}$ in. wide and long enough to make a ring round the part where the leak occurs. Tin the leaking part thoroughly, put fluxite on, the little tin ring over the offending place, and sweat it on with a very hot soldering iron. That union will never leak again, the thin tin strip holding the parts together much more effectively than soldering alone could do.

"My petrol tank (of brass) often sprang a leak along the top, where it had been joined. There also I sweated on a long strip of tin, and I have had no more trouble since."

"I wonder why carburetter makers do not fix the unions of the petrol pipes in a way that will last for ever, as the above strip does. Perhaps they think their way does last; but we know how often the unions come off."

**Dust in the Engine.**

PTE. A. DENDY, Nowshera, India: "Having read 'Ixion's' remark in *The Motor Cycle* of August 31st re dust being the cause of rapid cylinder wear, I thought perhaps you might like to hear of a somewhat similar instance which came under my notice. The machine in question was a 6 h.p. twin of well-known make, and the symptoms were a sluggish running engine and a decided rattle. The engine had just been taken down and decarbonised, so what was actually the cause was not looked for.

"Everything possible was done in the way of carburetter tinkering, and timing checked, but all of no avail, so in desperation the engine was again dismantled, and imagine our surprise on finding the oil in crank case like glue and choked with dust. It was gummed as thickly as could be on flywheels and inside case, pistons and all.

"The carburetter had the usual double gauze over air intake, so that it is difficult to suggest how the dust got inside the crank case. It could hardly have got by the piston in such quantities, and yet it was there. Also it was not in the oil tank, as this was not emptied, and the engine ran satisfactorily on town riding after.

"From this time onwards the engine had a decided piston rattle. I had not the necessary gauges to measure for wear, but have little doubt as to the cause; also the tappet guides were enormously worn.

"The majority of country roads on the frontier are nine or ten inches thick with dust, as they, as a rule, are unmetalled.

"Another fault I have found pretty frequently is gudgeon pin play in piston, the pins of driving fit variety being the offenders. Frames of sidecar outfits continue to break, mostly at the steering head."

**Mountainous Districts.**

"T.C.H.," Nilgiris, India: "This is a mountainous district, in which elevations run from 1,000 to 8,000 feet above sea level, and although, on the whole, our roads are good, we have an abundance of hairpins, 'Irish bridges,' etc., which are sufficient to give any newly arrived motorist, however proficient in the art, 'furiously to think.' In fact, I do not think you have anywhere in the British Isles such a 'sporty' district from the motor cyclist's point of view. To quote an instance: Our main 'ghat' road from Mettappolium to Ootacamund (thirty-two miles) rises 6,000 feet in that distance, has seventeen hairpins (always with the chance of a couple of bullock carts or a herd of cattle round the corner), and gradients varying from 1 in 8 to 1 in 30, without a single stretch on which one can 'rest' one's engine in the whole distance. A T.T. in this district would produce some fun! Another point which baffles most new arrivals here is the effect of the rarefied atmosphere on

their engines. No standard carburetter will give good results here until some provision is made to give the engine more air. The way in which the majority of machines stand up to their work in such a severe district is a striking tribute to British manufacturing principles. I know of a Scott (to mention one instance) which has done over 30,000 miles in three years, and has just been sold for over £40. Of course prices, both new and second-hand, rule high as compared with home prices; about 30% seems to be the average increase. In conclusion, let me say that, to compensate for our many drawbacks, we have a delightful climate, an equable temperature, incomparable scenery, and petrol at 2s. 1d. per gallon (war price) in this, the 'Queen of Indian Hill Stations.'"

**ITEMS FROM OVERSEAS.****Road Records.**

A considerable amount of interest has been aroused of late in the Overseas Dominions in town-to-town records. One of the latest comes from New Zealand, one of the favourite record road routes there being from Christchurch to Hammer Springs and back, the total distance being 174 miles. On October 2nd, Mr. Harold Jones, of Christchurch, mounted on a Harley-Davidson sidecar, made an attack on the sidecar record for this journey, which he succeeded in beating by 1h. 33m. The route is a very difficult one, and included several watercourses.

**High Speeds in Australia.**

The extraordinary speed of 103 m.p.h. is claimed to have been obtained on a motor cycle in Australia. In the early morning of October 7th, Jack Booth, the famous Australian rider of an eight-valve Indian, is credited with the above remarkable speed along a straight stretch on the Gawler Road. The distance covered was one mile, and the time taken 35s., which works out at just under 103 m.p.h. His machine was, of course, a 7.9 h.p. twin Indian, stripped of all unnecessary fittings, but was run without auxiliary ports, and what makes the figures the more remarkable (and probably doubtful to many record-holders) is the fact that he used large size tyres in order to comply with the local conditions. On the same morning E. Ferguson, a local rider, also mounted on an Indian, is reported to have established a South Australian half-mile road record by covering that distance in 19 $\frac{3}{4}$ s., equalling a speed of 92 m.p.h.

**AN OUTSTANDING PERFORMANCE.**

In the issue of Nov. 23rd we described the reliability trial held by the Victorian M.C.C. on Sept. 23rd under appalling weather conditions. In this event only one of the four competitors to finish completed the course to schedule time. The competitor was J. H. Rhodes, who, with his wife in the sidecar of his Powerplus Indian, covered the course in the best time, and won what is termed—appropriately enough!—the "winner's" cup.

## Test of a Spring-frame Hobart.

Adapting Front Fork Springing Methods to the Rear of the Machine.

A MONTH ago we described a rear springing device, owned jointly by Messrs. Richardson and Downs, both well-known men in the trade. In the interim we have been privileged to test a Hobart lightweight machine sprung at the rear on the same lines. There is no need for us to go into details again, as the sketch and photograph render the system sufficiently clear. The system is very similar to the Brampton front fork spring, Mr. Richardson, the designer, being connected with that company.

The machine we have been using is owned by Mr. Downs, who uses it regularly in his business. It was intentionally fitted with an old saddle of comfort in order further to

practically devoid demonstrate the efficiency of the springing system. For our test we naturally selected exceptionally rough stretches of road in the district, and we had no difficulty in finding pot-holes galore, thanks to the remarkably heavy and constant lorry traffic.

First of all, steering was entirely unaffected. We

found that road shocks were damped considerably by the aid of the coil springs, whilst riding on good ordinary main roads was positively luxurious. When pot-hole stretches were encountered, however, the springing did not show up to the best advantage, owing to the small amount of movement possible in the springs. This will be appreciated from an inspection of the springs, which have comparatively little space between each coil to allow free movement. This criticism, however, does not expose a defect of the design, but more of the type of spring fitted, and we feel sure that when fitted with larger springs allowing increased movement, the design will go a long way to solve the spring frame problem. It is conceivable that if this design were purchased in quantities, many firms would be disposed to adopt and fit it in the same way that they do the various accepted designs of spring forks now available for manufacturers who specialise in assembling. It will be appreciated that the design would be quite easy to adapt to the accepted type of motor cycle frame, requiring little or no structural alteration.

Hobart two-stroke fitted with front and rear springing devices.

Showing details of the rear springing.

## The Scott Sociable through American Goggles.

WHEN the Scott Sociable was described in *The Motor Cycle* a month or two ago, among the considerable number of enquiries which followed from home and Overseas was one from the Editor of *The Scientific American*, who expressed interest in the design, and mentioned his desire to publish details. We now have before us the issue of November 11th, in which the description appears, and we cull the following extract, as showing the American view of Mr. Alfred Scott's latest design:

"Another attempt has recently been made to provide a low-priced vehicle that will comfortably accommodate two people and give them practically all the comforts of a large automobile, and at the same time be economical to maintain and easy to operate and care for. This creation is the work of an English designer, and, as will be seen by the illustrations and the picture on the cover of this issue, he has produced a decidedly neat and

convenient little car; but interest does not cease with the general appearance of the car, for it embodies a host of ingenious details, only a few of which can be noted here."

*The Scientific American* replies to the criticisms which have been offered by some readers on the appearance of the machine in the following terms:

"Some comment has been made as to the appearance of this car, but the worst that can be said against it is that it is novel, and we all know that many a novel creation is approved as soon as we become accustomed to it, as is demonstrated by a comparison of the horse-drawn vehicles of twenty years ago and the present motor car. As to the question of practicability, it may be said that every individual feature involved has been thoroughly tried out, and the identical type of engine has been in successful use in England for at least six years. This little car can make as good an average speed as a regular automobile, and operate in places impossible for the latter."

### RECRUITS WANTED.

WE are informed that important work is being done by the 1st Battalion City of London Volunteer Regiment, Maj. E. A. Dodd, T.D. Commandant—Headquarters, 57-58, Leadenhall Street, E.C. Recruits are needed who ride either sidecar or solo machines. Further particulars can be obtained from Sergeant-Instructor T. J. B. Cross, 8, Upper Thames Street, E.C.

### A PROMINENT A.C.U. OFFICIAL.

WE congratulate Capt. A. E. Davidson, R.E., D.S.O., on his promotion to the rank of major, which was gazetted on Friday. Maj. Davidson was on many occasions judge at various A.C.U. competitions, and though not actually the rider of a motor cycle, he has a keen knowledge of the machine, and long before the war made a very careful study of the use of the motor cycle in warfare.

### HOW THE TANK MEN FARE.

THE following are some very interesting extracts from the diary of a member of the crew of one of His Majesty's Land Ships (Tanks): MONDAY.—Out in a fog. Completely at sea for first part of day, travelling at rate of 1,000 yards per hour. Furious gun fire and ceaseless racket of machine guns. Enemy attack. Enough lead to smother us. Came through unscathed. Went blindly at foe. Terrible crash and ceaseless jolting. Up and down like a switch-back. Dashed into a party of enemy, and crushed them under machine.

TUESDAY.—Out in abominable weather. Gun fire all the time. Vicious rattling on our metal hide. Machine guns everywhere; passed through without a scratch. Seemed to run into an earthquake. Nothing serious; only an enemy trench. Suddenly everything seemed to go wrong. Could not make the old thing move as much as half an inch. Stranded! Enemy thought we were done for and closed in with great glee; came right up to us. Still no sign of life; then sudden recovery. We opened fire; enemy went down like ninepins. Ship gave sudden lurch, then on as fast as we could. Enemy had not time to get clear. We knocked them over, and they were crushed underneath.

WEDNESDAY.—Had weirdest experience imaginable just as we were well under way. There was a sudden upheaval. "Tank" seemed to be lifted from the ground and tossed sky high. Felt sure it was all over. Terrible jar back on land again. Little the worse. Enemy had sprung a mine under us. Went forward again at full speed.

### MOTOR CYCLISTS WANTED IN THE R.F.C.

THE Royal Flying Corps is open to enlist a number of experienced motor cyclists. In order to be accepted men must have held driving licences for the last two years, and must be in Class A or Class B1. There are also openings for motor drivers, whose medical category must be B1 or B2. Application should be made to Major Robert Mitchell, organiser of R.F.C. Technical Instruction, R.F.C., the Polytechnic, Regent Street, London W.

### A CHANCE MEETING IN FRANCE.

THE accompanying photograph shows Sgt. H. E. Ashley and Cpl. H. J. Beal, both well-known amateur motor cyclists, who met accidentally a few weeks ago "somewhere" in France. These happy and unlooked-for meetings frequently occur at the back of the line, and in this case the riders commemorated the event by being photographed together with their mounts. Cpl. H. J. Beal, of Ilford, on the right, and his friend Ashley, who hails from Manchester, have several times competed in Six Days Trials with invariable success, mounted on L.M.C. machines. In civil life the former finds good use for his motor cycle as a commercial traveller, and is, besides, a well-known competitor in M.C.C. trials, notably the London-Edinburgh run. In 1913 Beal secured ten awards, including three gold medals and a silver cup, with his L.M.C., of which make the owner speaks most highly. Out in France the

Sgt. H. E. Ashley and Cpl. H. J. Beal, who previous to the war were enthusiastic riders of L.M.C.'s.

strain upon Beal is not so great as to some of the men, seeing that in England for five days a week he used his motor cycle for business purposes.

### FROM A MOTOR CYCLIST COLONEL.

WE have had an interesting letter from Col. D. F. Nicholl, D.S.O. (the judge in former A.C.U. Six Days Trials), since he has taken up his quarters in France. He travelled from the port of arrival to his destination by road, and his opinion on the road conditions over there are quite interesting. "The roads," he writes, "on the whole, are much better than most of the English main roads are in these days, and even up here, where *pavé* and mud abound, any amount of new metal is being shoved into the sides of the road, and soon gets rolled in by the incessant traffic, nearly all very heavy motor vehicles. I took out one of our bicycles, a new Triumph, and liked it immensely. The latest 4 h.p. is certainly some bicycle, and the acceleration is fine. The Triumph carburetter appears to be pretty automatic, though one cannot use full throttle on these bumpy surfaces, apart from other traffic on the roads, so I cannot say how the carburetter works at large openings."

### FROM A LORRY DRIVER

FROM Pte. J. F. Spencer, A.S.C., M.T., an official of the Coventry Motor Club, now serving with the 5th Australian contingent, comes a very cheerful letter. Among the general items of interest Pte. Spencer says: "I receive *The Motor Cycle* each week, and find it is greatly appreciated by others of the workshop party, and many who use our canteen. Since last writing we have moved our quarters, and are now stationed at —. We are situated on a main road, our lorries parked each side, with the workshops, etc., in a field. We sleep in a hut, fortunately, for every kind of weather comes our way—sharp frosts, rain, and strong winds. Our ablutions are performed in a running stream at 6 a.m., work commences at 7.30, and ceases at 4.30 p.m.; 'Lights out' at 8 p.m. The nearest town is about twenty minutes' walk, and from the state of the buildings there it is evident that our enemies have been ventilating their wrath. At the moment of writing two fellows are having a boxing contest, and as the dimensions of the hut are approximately 16ft. x 12ft., it is something of a job to concentrate one's mind on this epistle. As we are near an aerodrome plenty of 'planes are to be seen all day long. I have not yet come across a single fellow whom I know. I am keeping fit and well."

## THE FLAT TWIN AT THE BAR.

### INDUCTION PIPE DESIGN — DISPOSITION OF VALVES AND THEIR ACCESSI- BILITY —

#### THE "HOT" SIDE OF A CYLINDER.

**T**HE recent controversy on the alleged disadvantages of the flat twin of larger sizes, and "Ixion's" defence in particular, have interested me greatly.

To the designer accustomed to close investigation of every detail of design from all points of view the arguments against flat twins over 350 c.c. show nothing more than a lack of knowledge of the subject.

The most pitiable attempts are shown in sketches, every one of which is exaggerated favourably to illustrate the claims advanced, and unfavourably where it is attempted to show the disadvantages of the types disapproved of. For instance, in the type of pipe called "direct induction," the valve springs are not shown, because it is not possible to work them into the design without ruining the claims put forward. A truly journalistic touch!

The principal arguments against the flat twin of over 350 c.c. capacity appear to be summed up in "the difficulties that have to be overcome in the induction and exhaust pipe system" and "the innumerable bends and increased pipe lengths."

Why such difficulties do not arise in *small* flat twins is, to say the least of it, puzzling. One would imagine that these difficulties are associated with types, and not with cylinder capacity, and I must confess that I personally fail to see any connection whatever between cylinder capacity and the number of bends in the induction and exhaust pipes.

But supposing we ignore this blunder and investigate the deductions which follow. It is stated that with overhead valves the efficiency gained in a vertical engine is lost entirely in the horizontal, on account of the innumerable bends and increased pipe lengths, and the carefully arranged sketches above referred to are produced to prove that with side valves the induction passage has fewer bends. Actually it has more, and if a complete engine had been sketched, with all parts necessary to its working, this would have come to light. The induction pipe must leave room for a valve spring and valve gear, and this necessitates its entry at something approaching a right angle.

Fig. 1, which is properly drawn to scale, will serve to show this. Fig. 2 shows an overhead valve also drawn to scale, and both views show the path of the gases by means of arrows.

Fig. 1 (top). Showing the induction pipe arrangement on a flat twin.

Fig. 2 (bottom) indicates the cause of a "hot side" in an overhead valve engine.

A Defence (if one were needed) of the Flat Twin of over 350 c.c. capacity.

By GRANVILLE E. BRADSHAW,  
The Designer of the A.B.C.

Increased induction pipe length does not matter in the least, except that in nearly all engines this is an advantage, and one has only to read expert carburetter manufacturers' catalogues to find particular stress laid in fitting a considerable length of pipe between carburetter and engine to allow of thorough mixing of the gases. Further, the engine of high efficiency is invariably timed with a late closing inlet in order to obtain an increase of volume in the cylinder occasioned by the gas being carried in by momentum after the piston has commenced to travel on the up stroke.

A long induction pipe assists in piling more gas into the cylinder, and is therefore of great benefit where high efficiency per cylinder volume is concerned. But why is so much importance attached to the so-called impossibility of fitting overhead valves efficiently, when overhead valves are seldom desired, either by the manufacturer or the motor cyclist, neither are they fitted in the particular 350 c.c. engine which was put forward as "the finest example of opposed engine efficiency"?

Nevertheless, and just to show how far the question was studied before such wild views were expressed on it, I would remark that this "finest example of opposed engine efficiency" obtained its well-known and existing record of seventy-two miles per hour by the use of overhead valves. This speed has not been equalled by a single-cylinder engine of the same capacity, and yet it is asserted that overhead valves in flat twins cannot be efficient.

The remarks are unmistakably written to discourage the development of the flat twin, and yet we find the following admission, "here we have a design the very foundation of which is perfect balance—the designer's Utopia."

#### The Duties of a Designer.

What is a designer for if not to choose the best principle, and to make a commercial job of it? It is just this which determines the difference between the clever designer with an eye to development and the inefficient man satisfied with lesser victories, that are more easily achieved. The horizontal engine is the designers' Utopia, and yet it has no future! Surely this is not what one would call fostering the industry!

**The Flat Twin at the Bar.—**

The successful designer is the man who realises that difficulties are there to be overcome. He will say, if this is the best design I can score heavily by making a successful practical job of it—and this sort of thing ought to be encouraged by the technical press.

Another accusation is that the larger flat twin has not proved itself so successful as the little twin. Of course it has not, but it has not had a chance. The small flat twin has had many years in which to prove its value, and has entered into almost every competition and trial. Nearly all the large flat twins have materialised since the commencement of the war, and have had no chance of demonstration in competition. I can confidently promise the sceptical a rude shock when competition does start again.

Continuing, the writer in a contemporary says that why it is necessary to link minimum weight and b.h.p. together, in motor cycle engine designing, is beyond him. Truly this is surprising, particularly as it is generally recognised that the 350 c.c. flat twin so deservedly applauded has achieved its wonderful popularity on account of its lightness and handiness, combined with its exceptional power. Manufacturers are constantly aiming at light weight combined with power, and those who have attained this very desirable feature have been singularly successful. One would think it superfluous to add any remarks about decreased tyre wear, lower petrol and oil consumption, and greater hill-climbing capacity, with the light and efficient machine, but one is tempted to point such details out to those who are so short-sighted that they cannot see them.

**The Hot Side.**

In one sentence the critic says he does not know exactly what is meant by a "hot side" to a cylinder, but he *does* know that such a side cannot exist in an overhead valve engine! Perhaps I can enlighten him on a subject of which "Ixion" is evidently cognisant. In water-cooled engines the cylinder is kept at an approximately even temperature on all sides, due to the heat distributing capacity of the constantly moving water, and maximum power can be obtained for long periods. In air-cooled design, however, the material is very thin, and unfortunately generally of material of low heat conductive capacity: the result is that the exhaust valve has to be extremely carefully placed in order to prevent one side of the cylinder becoming much hotter than the other, and distorting the cylinder walls. I can assert, after years of careful experiment, that the reason the air-cooled engine is looked upon unfavourably for continuous high duty is principally due to this defect with its resultant leakage past the piston, blackening the rings, and scorching the oil. In some standard side valve engines that I have measured the distortion has been as much as one hundredth of an inch, and, despite the inexperienced assertions to the contrary, the distortion occurs even to a greater extent in many overhead valve engines.

A few minutes' consideration of the overhead valve design shown in sketch fig. 2, where I have shown the "hot side" shaded, should be very convincing, and I do not mind stating that this was the principal reason the A.B.C. overhead valve engine was discarded. In the new A.B.C. design, a perfectly concentric cylinder barrel of steel is used with a separate head, on which

the exhaust valve is isolated from the cylinder as much as possible, as shown in fig. 1. The result is that this engine can now be sold with a guarantee of twenty hours' running on wide open throttle, with a loss of power of not more than one per cent. throughout the whole run. A test of 150 hours has actually been successfully carried out, at the first attempt, and incidentally I might mention that a careful test has been taken of the wear on the roller bearing big end of an engine that has done over 11,000 miles on the road, and that "Ixion" was perfectly right in what he said. It was impossible, on an ordinary micrometer, accurately to read any wear, but on a special instrument this was found to be two-tenths of one thousandth (or one five-thousandth) of an inch.

To put it briefly, the flat twin is particularly desirable because its balance is practically perfect with only two cylinders—it is the lightest type of engine known—its impulses are at regular intervals. It is considerably cheaper to manufacture than the four-cylinder vertical prophesied to be the future engine, and it is more economical from almost every point of view.

It is extremely accessible, and has a minimum number of working parts. Overhead valves, which are more efficient than other types, can be readily applied to the flat twin, but for reasons foreign to this particular type of engine, they are not desirable in an air-cooled engine, except for short speed contests. Both cylinders can be operated from the same cams, and synchronisation is easy. Lubrication offers no greater difficulties than in any other type of engine, and there are no limits to its capacity for present-day motor cycle purposes. Its particular limitation is overall length, and unsuitability to the adoption of a long stroke, but its inherent capacity for revving easily counterbalances the latter.

Sgt. F. E. Barker, A.S.C., M.T., formerly with Zenith Motors, Ltd., off to dinner with a load of eighty-five stones. Of the many uses the motor cycle is put to in the great military camps, not the least appreciated is when it is commandeered as a "hack" to give acquaintances a lift.

## TIMES TO LIGHT LAMPS

## GREENWICH TIME.

Dec.	7th	...	...	4.20	p.m.
"	9th	...	...	4.20	"
"	11th	...	...	4.19	"
"	13th	...	...	4.19	"

## Sidecar Machine Guns on Home Defence.

In connection with the home defence forces, a Motor Machine Gun Section is to be formed. Offers of sidecars are invited.

## The Mersey Tunnel.

There is talk in Liverpool of a project to construct a tunnel beneath the Mersey, to afford direct road communication between that part of Lancashire and the county of Cheshire.

## A Missing Motor Cycle.

A three-speed late 1915 model Douglas owned by an R.E. officer was stolen from Chatbam on Friday. It is a 2½ h.p. model; engine No. 26,451, gear box No. 1,791, and cylinder No. 28,122. The machine has a clutch and kick starter, and in case any reader is offered it for sale he should immediately advise the police or *The Motor Cycle*.

## The Internal Combustion Engine.

In a paper read before the Royal Society of Arts on Wednesday last week some striking remarks were made both by the chairman, Sir Charles Algernon Parsons, and by Dr. Dugald Clerk, whose paper was on the internal combustion engine. In the course of his introduction Sir Charles said: "The internal combustion engine to-day ranks among the most important prime movers. It is also the most economical in the conversion of the energy in oil and gas into mechanical work. On it depends all aircraft, and nearly all submarines and motor transports of all descriptions. It has become an ever present part of our modern life, and is exercising on the community at large an educational influence in mechanics and engineering far greater than we are accustomed to suppose."

## German Influence.

Dr. Dugald Clerk, who in the near future will be assuming an important Government position in connection with developments in this country, said that "Some of our engineers seemed unaware of the leading part taken by England in the great field of invention covered by internal combustion engines. An impression that we are wholly indebted to Germany, and that the work of invention here is small compared with that of the Continent, has arisen, because of the indefatigable propaganda of scientific engineering Germany and the

distinct bias to German methods shown by some of our prominent men. The younger engineer of to-day has a huge field of effort open to him, and he will need all the scientific and practical knowledge available to fit him for his task. The fate of the British Empire in the future depends on the scientific engineer; our present existence, as a free nation, depends on our sailors and soldiers, but the distant future is subject more to the efforts of the engineer than to the labours of war or politics."

## Triumph Cycle Co.'s 30% Dividend.

The directors of the Triumph Cycle Co., Ltd., are unable to submit the accounts usually presented to the annual general meeting, owing to the fact that the company was declared a "controlled" establishment in August, 1915. Until an adjustment of accounts has been made with the Ministry of Munitions and the Inland Revenue Department it is quite impossible to present reliable figures as to the net result of the company's trading since the dates of the last accounts. The directors are satisfied, however, that the company has made sufficient profit to justify them in paying 6½% (free of tax) on the preference shares, which absorbs £2,627; 20% (free of tax) on the ordinary shares, £16,000; a bonus of 2s. per share on the ordinary shares, £8,000; and to carry to pensions fund the sum of £2,000.

## SPECIAL FEATURES

MOTOR MACHINE GUNS FOR CADET CORPS.

WAR MODELS ON TEST.

THE CARE OF HUB GEARS.

## American Style.

Will trade.—For three-speed twin, will trade complete motion picture outfit, with gas machines, Powers's electric, with rheostat; taken in on mortgage. Good as new; worth 250 dollars. Packed in travelling trunk.—*Vide American Motor Cycling.*

## The Future of Second-hand Shows.

The promoters of the display of second-hand vehicles held at the Agricultural Hall recently write in an optimistic vein concerning the holding of such exhibitions in the future. Judging by the diverse location of some of the sellers and buyers at the show recently held, it must have attracted motor cyclists from all parts of Great Britain. The towns where it has been definitely decided to hold shows either yearly or bi-annually are Birmingham, Glasgow, Edinburgh, Bristol, and Dublin. Messrs. Glass and Co. hope to announce the dates shortly, but, owing to most of the halls being still in the occupation of the Government, nothing definite can be stated at present.

DESPATCH RIDERS OF THE FRENCH ARMY.

The men shown in the photograph belong to divisional headquarters, and have been in the neighbourhood of Verdun since the beginning of the great German attacks. Their mounts are B.S.A.'s and Triumphs.

**Another Airman Motor Cyclist Killed.**

We regret to note among the casualties the name of George L. Columb, Sec.-Lt., London Regiment, attached to the R.F.C. Lt. Columb was well known to Midland manufacturers and competition riders as a motor journalist.

**The National War Funds.**

At the week-end the principal war funds stood as follow:

The Prince of Wales's Fund (distributed £3,489,465) ..	£6,000,706	0	0
British Red Cross Fund ..	5,366,677	11	6
The Queen's Work for Women Fund ..	170,924	10	1
Tobacco Fund ..	120,471	0	0

**Large Size Flat Twins.**

In defence of the flat twin-cylinder engine over 350 c.c., a leading motor cycle designer, Mr. Granville E. Bradshaw, enters the arena this week. It is a pity that the time is not propitious for an actual demonstration of the qualities of large size flat twins—not that their efficiency is doubted by more than a minority.

**A Posthumous Award.**

Mrs. Baxter, wife of the late Sec.-Lt. E. F. Baxter, V.C., late Liverpool R., received the posthumous award at Buckingham Palace on Wednesday last. It will be remembered that Lt. Baxter was awarded the Victoria Cross for conspicuous bravery whilst engaged in bombing the enemy trenches. His exploits were fully described in our issue of October 5th.

**Competition Rider Granted Commission.**

S. Charles Perryman, a leading official of the Birmingham M.C.C., has been granted a commission as Lieutenant R.N.V.R. for R.N.A.S. Perryman will be recalled by all motor cyclists as a T.T. and competition rider. He has, in fact, competed in no fewer than seven T.T. races, and has, moreover, won three gold medals in London-Land's End trials. He was chiefly responsible for the introduction of the Senspray carburetter.

**Wheeling Cycles at Night.**

In the London area, hitherto, cyclists wheeling their machines at night, even on the edge of the roadway, were liable to be fined, though throughout the rest of the country this stringent Order has been modified. The Home Secretary has now stated in a letter to the secretary of the Cyclists' Touring Union that an amendment will be made in the Lights (London) Order at the next convenient opportunity, and that in the meantime no action will be taken against cyclists who take advantage of the proposed relaxation, but he does not see his way to authorise a similar relaxation in the case of tricycles.

**Should Unlit Cycles be Wheeled?**

The Auto Cycle Union is not satisfied with the proposal that the lighting regulations as regards pedal cycles shall be relaxed, so as to permit them to be wheeled close to the edge of the road without warning lights. The A.C.U. secretary has addressed a letter to the Home Secretary protesting against this proposed exception to the general rule, and pointing out the danger of unlit pedal cycles, even if wheeled on the left of the road.

**Real "Tail" Lights.**

The new British Order requiring drovers in charge of cattle to carry a warning light will be fresh in our readers' memories. Near Los Angeles a disastrous accident occurred recently, a lady driving her car into a drove of mules. In order to overcome the possibility of such an accident in the future, a red reflex light mounted on a strap is now used to buckle around the mules' tails.

**Volunteers and Cadets.**

Volunteers are at last to be recognised under certain conditions. The announcement of the terms of recognition was made officially last week, and would please thousands of our readers who are members of motor volunteer sections. Another development of interest to men on Home Service is the decision to form sidecar machine gun batteries for attachment to cadet battalions.

**A Sunset Table.**

We have received from the Under Secretary of State a copy of "Tables of Local Sunsets," which may be purchased, price 1d., from Messrs. Wyman and Sons, Ltd., 20, Breams Buildings, Fetter Lane, E.C. These tables have been prepared in connection with the Orders under the Defence of the Realm Regulations with regard to the lighting of lamps on vehicles. The times given in the tables are in all cases the times of local sunset (Greenwich mean time), "sunset" being taken as the moment when the upper edge of the sun reaches the horizon. The times of sunset are stated for twenty-nine places in the United Kingdom, and the figures given have been furnished by the courtesy of the Astronomer Royal.

**Water-cooling Systems.**

For the next few months hard frosts may be expected any night, and riders of water-cooled machines, such as Scott, Humber, Williamson, and Morgan, will no doubt be already wondering whether they will risk a frozen water jacket or radiator or go to the trouble of draining off the water after each run. Those who are interested in this subject should see the article in our sister journal *The Light Car*, which describes a simple home-made device which has been designed to keep the water in the system circulating and so to prevent freezing.

**Quantity Production and Overseas Trade.**

"British Subject" in *The Autocar* this week discusses the future of the British motor business Overseas, and hits the nail on the head when he says that "directly you go for quantity (production) at all you must fight in the quantity market of your class, and the mere fact that you must turn out a large number of cars of some one model without alterations means that you cannot cater for the individual who has his own special ideas." That will be a point in our favour when the time comes for us to commence the new war for trade supremacy in the Colonies. That one asset and the other of fine quality are, in the eyes of some pessimists, about all we have left. We certainly have some leeway to make up; the records of the American exports of motor cycles to the Colonies at the present time do not make particularly cheerful reading.

**THE NATIONAL MOTOR VOLUNTEERS.****Inspection of the Lancashire Volunteers by Lord French.**

SATURDAY, the day appointed for the inspection of the Lancashire Volunteers, was a red letter day for Preston. All the main streets from the railway station to Avenham Park were lined up with the Royal Field Artillery, and the streets were almost impassable. As it was impossible to handle all the members of the National Motor Volunteers, it was ordered that sixteen should be the number to represent each section of the N.M.V.

The Blackpool men paraded at the No. 3 Assembly Hall at 11.30, where, at the invitation of Half Squadron Commander V. Prestwich, the company partook of lunch.

At twelve o'clock the men proceeded, under the command of Half Squadron Commander V. Prestwich, Adj. S. O. Taylor, and Sgt.-Maj. Sanderson, for inspection at the Town Hall by His Worship the Mayor, Commander A. L. B. Parkinson. After a brief halt here they wended their way to Preston. Outriders Robert Hall and J. Wilkinson, who had proceeded two hours before, carried out their duties remarkably well, and awaited the Commander at Lea Gate Hotel with a map of the route to be taken through Preston and the place of inspection. Arriving at Preston, the section took up its appointed place along with sections from the East Lancashire district.

The six staff cars awaiting Lord French and party at the station required six motor cyclists to accompany the party as orderlies, and the selection was taken from the Blackpool contingent, which can be considered one of the honours of the day. The men were Cpl. T. Sharples, Ptes. Rogers, Clough, and Miller, Bugler Horner, and Drummer Clarke. The sight was a magnificent one.

**New Volunteer Bill.**

It will be remembered that, as announced officially last week, the Volunteers have at last been formally recognised by the Government. A man can now volunteer for the duration of the war, in which case he will be liable for certain drills and duties, be subject to military law (the men when engaged on military duty and the officers at all times), and receive a grant. Those who volunteer for the term of the war will not be allowed to retire from their corps except under special circumstances.

**AN ATTRACTIVE ALMANAC.**

LAST year we received a very artistic almanac published by Messrs. Abdulla and Co., Ltd., 168, New Bond Street, W. This year we have received another, which contains fourteen reproductions of work by British and Allied artists. As was the case last year, twenty thousand copies of this almanac have been given by Messrs. Abdulla and Co. for sale, the proceeds of which go to the funds of the British Red Cross Society. The price per copy is 1s. 4d., and it is hoped that at least £1,000 will be realised.

# WAR MODELS ON TEST

ONE of the several flat twin - cylinder motor cycles which have made their bow to the public this autumn is the  $3\frac{1}{2}$  h.p. Humber, described in detail in our issue of October 12th last. Since we first inspected and introduced this machine to motor cyclists, we have been privileged to test its capabilities on the road. Before dealing with the running of this entirely new mount, it might be well for us to recount its main features of design. The bore and stroke of each cylinder are  $68 \times 68.75$  mm., giving a cubical capacity (or cubicity, as a well-known designer put it the other day) of 497 c.c. In the description of this new Humber we dwelt upon the substantial nature of the

The W.D. Triumph and Humber at the Round Tower at the summit of Edge Hills, Warwickshire.

working parts; indeed, the solidity of the design is its most striking feature.

The machine we rode was fitted with ordinary touring handle - bars, footboards, and a foot - controlled clutch. As our riding experience included stretches of greasy roads, the need for a semi-T.T. position to impart to the rider a greater feeling of security and control over the

machine was rather pronounced. Accordingly we suggested to the makers that their latest twin would be rendered still more attractive by the fitting of a flat bar, a handle-bar controlled clutch, and footrests in lieu of footboards. Our suggestion was acted upon, and the first example of the type outlined is illustrated on this page. The natural riding position of the Humber tester, seen in one of the photographs, will be appreciated by practical riders who desire a machine for all-weather work.

During our tests of the Humber machine, which were made on the noted Edge Hill range, we had as companion a well-known motor cyclist, to whom we loaned for the occasion our War Office model 4 h.p. Triumph, the idea being that we could compare side by side their respective capabilities. On the one hand, we had a

representative type single, and on the other an attractive flat twin of 500 c.c., a type of machine upon which readers have often urged manufacturers to concentrate their energies.

## A SEMI-T.T. FLAT TWIN HUMBER.

The new  $3\frac{1}{2}$  h.p. flat twin Humber was dealt with in our issue of Oct. 12th last (pages 311-313). Since that date certain modifications rendering the machine more suitable for military requirements have been effected, such as the fitting of semi-T.T. bars with a handle-bar controlled clutch and footrests in lieu of footboards.

**War Models on Test.—**

Within two minutes of our visit to the garage both engines were firing away merrily, both with entirely different voices. The air was crisp and dry on this autumn morning, and we sped through avenues of trees over falling leaves, the hedgerows in their autumn garb, and the ever-changing tints being delightful to behold. Through Leamington and Warwick, thence through Barford and Wellesbourne

towards Kineton, we maintained a good average speed, our object being to tackle Edge Hill, the most severe of the range, with hot engines. Of course, nowadays there is nothing exceptional in climbing the 1 in 6 gradient of Edge Hill after a non-stop run from the city of motors, but now that change-speed gears are generally adopted it is instructive to observe how far a machine will climb the hill before calling for a change down. We led the way on the smooth-running Humber, and at the foot of the hill opened out, and away the machine darted, revelling in its work. The roads were deserted, and the machine was travelling so fast that it was only just possible to scrape round the first bend without switching off, and the next bend was reached with very little perceptible falling off in speed. Then on the steepest portion the engine commenced to slow down, and, glancing over our shoulder, we saw that our companion was rapidly overhauling us on the Triumph. Side by side we progressed, the Humber just losing ground, so we snicked in the second gear, and the twin attained its maximum revolutions again in the space of a few yards despite the severe gradient. Soon we had overtaken and left the Triumph standing, the twin romping over the summit of the hill on its middle gear, the Triumph rider, who had been late in changing, following thirty or forty yards in the rear. A descent of the hill for another try with cooler engines gave an opportunity of proving that both machines were capable of climbing the hill on the top gear, but near the top they were much faster on the middle gear. Partly descending the hill with the Humber, we turned the machine round, and, engaging the clutch, made a restart on the steepest section without difficulty or

real effort. Turning in the narrow road with the engine running demonstrated to us, however, that the foot clutch and footboard could very well be improved upon.

**Acceleration Powers.**

Proceeding to Sunrising, again both machines toyed with the gradient, and were even able to answer to the throttle whilst still on top gear. On the middle gear, engaged at the corner, it was possible to slow either machine right down and suddenly open up, the engines responding in a twinkling and gathering speed to the summit.

We next tried an acceleration test on the level, the weights of the riders being approximately the same, viz.,  $12\frac{1}{2}$  stone, and the top gears of the machines approximately equal, viz.,  $4\frac{3}{4}$  and  $4\frac{7}{8}$  to 1. At a signal when travelling at 10 m.p.h. the throttles were suddenly swept open, and both machines bounded away, the Triumph, with its 550 c.c. engine, just having the advantage in

two bursts.

Warmington Hill is much easier than Sunrising and Edge Hill, and both the main road and by-road, which crosses the hill at the church, were as nought to these delightful war models. One could stop and restart with ease on any portion of the hill.

So far we have dealt mainly with hill-climbing and acceleration, but it would be unfair to lead readers to suppose that the twin Humber in particular can be judged on these two counts alone. It is in the controllability of its engine and smoothness of running generally that the Humber is so attractive to the rider. With its one lever Loguemare carburetter the engine will tick

along so slowly and regularly that it is easily possible to count the explosions.

Throughout the test, despite its newness, the engine kept remarkably cool. Even when cold the engine would start after two or three turns of the starting handle without the necessity for an injection. Altogether our experience proved most enjoyable, and left us with an impression that a good deal more will be heard of the  $3\frac{1}{2}$  h.p. flat twin Humber when the company have satisfied the demands of the allied Governments.

At the bend near the summit of Sunrising Hill, where the gradient is approximately 1 in 6.

A top gear climb up Warmington Hill, near Banbury.

## 1917 AMERICAN TREND OF DESIGN.

Details of some of the  
Principal Exhibits at  
Chicago Show.

Mechanical oiler and brake pedal on Dayton models.

The Emblem three-speed gear is actuated by a rocker pedal on the right footboard.

On the Henderson a small ammeter is fitted on the top tube, set at an angle to facilitate easy reading.

Dry battery case on Henderson, made of pressed steel and attached to the seat tube.

THE motor cycle show held at the Chicago Coliseum gives a very good indication of the trend of motor cycle design in America. Probably the most notable and drastic change in design is the introduction by the Hendee Company of the small flat twin lightweight, which, undoubtedly, anticipates a greater demand in the future for the lighter twins as solo mounts in place of the heavy 7 h.p. twins as heretofore. Although the baby two-stroke has apparently made little headway, some firms are still manufacturing them, so there is evidently a certain demand for these machines, though evidently nothing like so great as that which exists in this country. With regard to the ordinary machines, the only alterations in design noticeable are improvements in details, while efficiency has been aimed at by improving the design of such parts as valve ports, inlet pipes, exhaust pipes, etc. The three-speed gear, usually placed in the countershaft, is also a feature of practically all 1917 models, while electric lighting outfits are now almost universal on all but the lightweights.

In looking through the specifications of the latest models, it is interesting, and at the same time almost amusing, to notice how the horse-power ratings of the engines have gone up, although the capacities remain the same. It is quite common to see what are generally known in this country as 7 h.p. twins rated at 16 h.p., while 6 h.p. is the common rating for many single-cylinders under 600 c.c. With the exception of the flat twin, the Indian models remain unaltered, though an interesting detail point of the 1917

model Powerplus is the fitting of valve caps equipped with extensive radiating fins. This is a most desirable feature, for, as mentioned many times before in this journal, the masses of metal usually situated in the neighbourhood of the valves are often the prime cause of many overheating troubles. Another slight alteration in design in the Powerplus Indian which is of interest is the fact that the pocket beneath the inlet valves has been eliminated in order to allow the incoming gas to flow easily into the cylinder.

Enclosed valve springs are becoming standard on most American mounts, and are to be found, to mention only a few makes, on the Indian, Harley-Davidson, and Reading Standard, in which makes they take the form of telescopic sleeves.

Several of the big twins even now require the engine to be removed from the frame before the cylinders can be taken off. In the Excelsior provision is made so that the tank tube can be removed so as to give room for dismantling cylinders.

The Henderson power unit is undoubtedly a very neat piece of work, and, as mentioned in a previous review of American models, contains a three-speed gear box situated at the rear end of the crank case, the bottom half of the crank case casting forming the lower half of the gear box.

The chief alteration in the latest four-cylinder Henderson is the inclusion of a three-speed, sliding dog clutch type gear box incorporated as a unit with the engine. The overhead inlet valve rockers are also much more substantial. This 8-10 h.p. engine, as most of our readers will already know, follows car practice throughout.

# MOTOR CYCLIST GUIDES.

A Reader's Suggestion and a Reply by the A.C.U. Secretary.

**T**HE following interesting letter has been received from a reader, who considers, and we think rightly, that a minute geographical knowledge of the whole country would be useful to the military authorities. It seemed to us that, if such a corps were to be formed, it should be done under the auspices of the A.C.U. We therefore consulted the secretary, and append his reply to our correspondent's letter:

## The Suggestion.

Sir,—I notice that you give the Volunteer movement, as far as it affects motor cyclists, your hearty support. Such being the case, could you not organise a National Corps of M.C. Guides?

A guide should know thoroughly some hundred, or even more, square miles of country. By "thoroughly" I mean—

1. All roads and byroads.
2. All bridges, and—
  - (a) Whether over road, rail, or water.
  - (b) Approximate weight they will each carry.
  - (c) Length of span.
3. Nature of country—arable or pasture; character of field boundaries—hedges, ditches, stone dykes, etc.
4. Any other special characteristic of the district.

In my opinion, a body of men possessed of such information as I have above stated would represent a human map of considerable value to the military authorities.

I would suggest a head guide in each county—perhaps more in special cases—and, in addition, one more guide per one hundred square miles. A register of such guides, showing areas, could be kept at the various military centres.

I should mention that about two years ago I endeavoured to form a similar body of guides from my fellow officers in the Excise Department. Over 800 volunteered readily, but, owing to lack of official encouragement and time, the matter dropped. As far as I can remember, the War Office stated that motor cycling sections were being formed in the different counties. I have, however, after several enquiries, failed to find that a body of men of the type indicated have been enrolled as volunteers.

It may be asked why I have not again brought the matter forward in my own department? I should like to have done so, but my belief now is that the body should be composed of motor cyclists only.

In the event of the idea receiving your support, I should be pleased to do anything in my power in this part of the country.

Wolsingham.

## Cadet Corps and Motor Machine Guns.

War Office Approval for Formation of a Machine Gun Section.

**T**HE good work in connection with Cadet Corps throughout the country is to be further aided by a new development now in progress. The Motor Machine Gun Service now forms a very important section of our Overseas forces, and their great value has been proved beyond all doubt. With this example before them, we are advised by an officer interested, the War Office has sanctioned the formation of Motor Machine Gun Sections of each Cadet Infantry Brigade throughout the country. At present the authorities are not supplying the necessary motor equipment, and steps are being taken to raise the required number of motor cycles and sidecar chassis by loan or gift from various sources.

The Warwickshire Cadet Infantry Brigade, under Col. Ludlow (who holds the rank of brigadier-general in this connection), is progressing rapidly with the new scheme. Capt. B. Fray, the machine gun officer

## The Reply of the A.C.U.

"C.J.L.'s" suggestion is valuable, inasmuch as it draws attention to the military value to the Volunteers of the motor cyclist as a guide, and for despatch carrying and communication purposes.

His idea of a separate "National Corps of Motor Cycling Guides" is impracticable in the present condition of the Volunteer movement. Such a corps would be analogous to the Motor Cyclist Section, Signal Service, R.E., and presupposes the grouping of Volunteer Battalions into brigades and divisions, each with its complement of auxiliary services, of which the Signal Service would be one. Such an organisation of the Volunteer Forces, however desirable, is remote, and in the event of invasion and mobilisation no attempt would, I think, be made to use the Volunteers as a separate mobile force, complete in itself. They would then undertake special duties in connection with the guarding of lines of communication and the preparation of defence works, and they would possibly act as reserves to our regular infantry.

The value and the use of Motor Cyclist Volunteers seems to me to be essentially of a local character. Their knowledge as guides would be that of a particular locality, and they would be of great value to the particular Battalion operating in that locality. The Volunteer Force is organised on the Territorial basis, the Battalion composing a county regiment having its headquarters in various parts of that county. On mobilisation the Volunteers would, as a general rule, take up duties in their own districts.

This is not to imply that there is no necessity for co-ordination. On the contrary, I consider that the standard and methods of training, and to some extent recruiting, of Volunteer Motor Cyclists should be under the direction of a central authority. For discipline and command purposes they would be under their Battalion C.O., who would also be responsible for their training and readiness for war and for the maintenance of proper system in the section.

The Central Association might be requested to arrange for:

1. A syllabus of training for motor cyclists other than the usual training in signalling.
2. Examinations and certificates of proficiency.
3. Circularising of County and Battalion Commandants, drawing their attention to the military value of motor cyclist volunteers, and encouraging them to recruit such men.

In all these matters I should be pleased to give any assistance possible.

(Signed) T. W. LOUGHBOROUGH,  
Secretary Auto Cycle Union, Major Surrey Volunteer Regt., etc.

appointed, and Sec.-Lt. E. L. Girling are busily engaged in collecting together the necessary sidecar outfits to form their equipment. Twenty-four are required, and offers by any patriotic manufacturers or private owners who may have new or second-hand machines which they care to devote to this work would be appreciated. *The Motor Cycle* will gladly place any such offers before the proper authorities. Heavy machines, preferably about 6 h.p., with sidecar chassis only, capable of carrying three men, are necessary, but some solo machines also will be very acceptable. These Cadet Motor Machine Gun Sections are nearly complete in point of members.

The intention to make the Cadet Corps training still more efficient by the introduction of this, one of the latest forms of military operations, is very commendable, and will be watched with considerable interest.

The Editor does not hold himself responsible for the opinions of his correspondents. All letters should be addressed to the Editor, "The Motor Cycle," Hertford Street, Coventry, and must be accompanied by the writer's name and address.

#### Water in a Petrol Engine.

Sir,—In reference to a paragraph of the article signed by Mr. S. Holt in *The Motor Cycle* of November 9th, I would like to state that the idea of introducing water into the cylinder of his engine is by no means new, for the same was patented by Prof. Banco in Germany some years ago, and the said Professor claims that the water is immediately dried by the intense heat, leaving behind a hydrogen and oxygen gas, and by these gases the engine gains its advantageous properties. Therefore I really cannot see the grounds on which Mr. Holt can patent his idea without encroaching on international patent laws. Prof. Banco patented his idea for internal combustion engines, which, of course, includes petrol engines. L.G. (R.N.).

[As we stated in a recent issue, the idea of injecting water into an internal combustion engine is not new, but though the idea may not be patentable, it is quite possible that the method employed would be subject matter for a valid patent.—Ed.]

#### Throttle-controlled Lubricators.

Sir,—With reference to the various apparatus constructed within recent years to couple throttle and oil supply, I think I can fairly lay claim to have been the first to advocate the system; in other words, to point out that the feed of oil should be proportional to consumption of petrol. I cannot at the moment put my hand on the papers; but, from recollection, the lecture at which I first made the suggestion, as an ideal to be aimed at, was before the Essex Motor Club, in the spring of 1907—March, I think. Anyway, Mr. A. G. Reynolds remembers the occasion, and can confirm.

The Best and Lloyd mechanical pump with throttle control is most efficient, as engine speed as well as throttle is allowed for. Coasting down hill with the throttle shut consumes some oil, and the B. and L. passes a little oil in proportion to the engine speed. In the case of the drip feed controlled by the throttle, with the throttle shut coasting, a little oil might pass, but the quantity would be constant and irrespective of engine speed, which is not right.

J. W. G. BROOKER.

#### Coloured Lights for Cattle.

Sir,—With reference to "Ixion's" paragraph on the above in the issue dated November 9th, I have had the necessity of distinctive coloured lights borne in upon me by the following experience. When returning home the other night about 9.30 I encountered eight or ten horses, led in pairs, on the left side of the road approaching. The leading man (or boy) carried a white light, quite steady, about 18in. above ground level, which I naturally took for a cyclist's lamp. I was going very cautiously at the time, preparing for a corner, but only a white blaze on the outside leader, which I caught sight of just in time, saved me from a spill. I did a lightning swerve and pulled up, and then heard what seemed like countless hoof beats. The road was about 12ft. wide, and the horses in pairs occupied about 8ft. of this space. The man leading the rear pair also had a glimmer of white light, which was totally invisible from behind the horses. There was absolutely no waving or swinging of lights whatever. With the dimming discs now in vogue, there is no chance of detecting cattle or horses in time to avoid disaster at above 10 m.p.h. My point in this case is that if a distinctive coloured light had been shown I should have known what to expect on the road. The kind of incident described is fairly common in this district (Brackley).

BT8

Perhaps after a few serious accidents have occurred the regulation will be amended. I hope you will continue to raise the point in your valuable journal, which I have read regularly since 1903, though this is the first time I have written to you. W. CHARLES ROBSON.

#### Will the Single Cylinder Survive?

Sir,—One cannot help noticing with interest in the correspondence columns of your excellent paper, the various missives dealing with the supposed superiority of twin-cylinder machines over singles. Judging from their contents, I venture to say that an impartial observer reading them over would soon make up his mind to make any and every "single" his absolute *bête noire*!

Now I am the—let me say, "unfortunate"—possessor of a  $3\frac{1}{2}$  h.p. single motor cycle, purchased new in 1915. May I then be allowed to lay bare a few facts about my machine which I think will show that twins have not it all their own way just at present.

The week ending October 28th, I went for a run of 132 miles with a friend. We were both mounted on singles. I allow the roads were pretty good—most of the way we were on the Portsmouth Road—at the same time they were inclined to be slippery, as there were several showers; also we had to contend with a strong head wind the whole way. The first twenty miles or so were through traffic, as we had to pass through the south suburbs of London.

Our speed worked out at 33 m.p.h. which—as we did not attempt any abnormal speed, the maximum done being 50 m.p.h.—shows a fairly good constant speed.

As regards power my throttle slide was never more than half open.

The most satisfactory result, however, was our petrol consumption, my friend's working out at 120 miles per gallon, mine as 140 m.p.g.; both figures, to say the least, are fairly useful.

The two machines in question are 490 c.c. Nortons, mine being the ordinary three-speed countershaft touring model, my friend's the standard T.T. The usual disclaimer.

M. A. PYKE.

#### Paraffin Starting Device.

Sir,—I notice from your issues of October 26th and November 2nd that your correspondents "Brightonian" and Mr. F. Lewis would like further particulars of my method of starting up for running on paraffin, so I am giving a detailed description of how this is carried out.

The petrol is contained in a small tank and led to the jet in the anti-blow back cap by means of the ordinary  $\frac{1}{4}$ in. diameter copper pipe (see page 233, September 14th). I find that a common failing is to attempt to use too large a jet in this position as a most suitable size is, to give satisfactory starting, a 24 Amac, as, of course, if too large a jet is employed too rich a mixture will be drawn into the engine, and considerable difficulty will be found in starting. This method is quite satisfactory with practically all types of engines; but, if possible, the head of the jet should be  $\frac{3}{16}$ in. from the carburetter slides, and as near as possible in the middle of the tube.

With reference to Mr. Lewis's remarks, the two-stroke machine that I am now using has a Best and Lloyd drip feed oil pump fitted, and with this the same amount of oil should be used as when running on petrol. However, if the machine should be fitted with the petrol system, the correct proportion of oil to paraffin is half a pint of oil to a gallon.

of paraffin. It is a well-known fact that when paraffin is used a small jet is required to break up the heavy fuel; but, if this is used, the power obtained will not be very great, so, to get over this difficulty, I have sealed up the hole in the jet of my Amac carburetter and drilled three small holes, each about a third of the size of the Amac 28 jet. Any watchmaker will be able to carry out this work at a minimum of expense. However, if this is not carried out, for general running I have found the 27 Amac most satisfactory.

F. A. MILWARD.

#### Bearing Pressures.

Sir,—“A.A.S.’s” article on the above subject contains no reference to the relative quantity and quality of work obtained from the two types of engines discussed. All reference to such essential features of good running and efficiency as petrol consumption, oil consumption, speed, pulling power, and cool running, of the two machines is omitted. The public would like to know which of the machines did the better all-round work.

He also compares machines of completely different cubic capacity. I have had five long-stroke singles, including one of the 82×120 mm. type criticised by “A.A.S.,” and I know of no better lubricated single. I gave mine some hard work, too, both pulling and revving. Reading his article made me wonder why he did not choose a square engine for purposes of comparison. Then we might have had some valuable data.

Despite “A.A.S.’s” condemnation, a complacent motor cycling world is slowly being given in homœopathic doses what it refused a few years ago—the long-stroke engine. Even the flat twin is getting inoculated with the virus. Witness the Matchless and Brough productions; their performance will be watched keenly.

B.E.F.

A. LINDSAY (Capt.).

Sir,—With regard to the letters in reply to mine, in the issue of November 23rd of your esteemed paper, *re* “Bearing Pressures.”

(1.) With regard to this point, I am quite prepared to go by the opinion of manufacturers. I have yet to see an engine with a piece taken out of the flywheel rim, and should be pleased to be informed of one out of the hundreds of different engines made. This, I think, fairly establishes the point on Mr. Bonython’s own reasoning.

(2.) This point I will explain fully, thus: Assuming an explosion pressure of 200 lb. sq. in. on piston head.

Area of 82 mm. piston = 8.18 sq. in. Total explosion pressure = 1,636 lb.

Bearing area of crank pin = diameter × length =  $\frac{7}{8}$  in. ×  $1\frac{3}{8}$  in. = 1.2 sq. in.

Pressure per sq. in. =  $\frac{1,636}{1.2} = 1,363$  lb. per sq. in.

Area of 88 mm. piston = 9.42 sq. in. Total explosion pressure = 1,884 lb.

Bearing area of crank pin =  $D \times l = 1\frac{1}{2}$  in. ×  $1\frac{3}{8}$  in. = 1.72 sq. in.

Pressure per sq. in. =  $\frac{1,884}{1.72} = 1,095$  lb. per sq. in.

Now, it is customary to keep bearing pressures as low as possible, and certainly not to exceed 800 lb. per sq. in. in first-class practice. It is perfectly clear which of these engines approaches the pressure which is thought to be best practice. Also, it is obvious even the medium stroke engine is a long way off being correct, as 200 lb. the explosion pressure taken, is easily exceeded in certain instances. I conclude, therefore, we can do with a larger bearing in both instances, and that, this being the case, the arguments which I brought forward are correct, and hold good for any reasonable size of engine. The remainder of the question is rather a misconception—I expect, unconsciously. The point is this. In each revolution of the engine the crank pin rotates once in either case. The distance turned is  $\frac{1}{2}\pi$  and  $1\frac{1}{2}\pi$  respectively inside the big end bush. The first turns under a pressure of 1,363 lb. per sq. in.; the second at 1,095 lb. per sq. in. In the sense in which I mentioned the distance, I intended the distance measured the path of the circle the crank pin centre describes during one upward and one downward stroke of the piston. The other is too obvious to need elaboration. Of course, the crank pin rotating under least pressure in our case will suffer least

wear, as the pressure is outside the 800 lb. per sq. in. which is advisable.

(3.) I am pleased to see Mr. Bonython agrees on this point.

(4.) The only reason I can think of for this statement is because the long stroke engine is larger than the medium stroke by the ratio of 12 to 11 suggested (approximately). I think, however, for this point we must take engines of equal capacity, I only having used the example I did because I had no other to hand. However, the basic argument of greater centrifugal pressure is admitted, and I take it Mr. Bonython is again in agreement with me, at least, judging by his figures.

(5.) This, again, is rather a misconception. In the formula  $F = \frac{Wv^2}{gr}$ , it is so self-evident the larger “ $r$ ” is the smaller  $F$  will be that I did not think it necessary to explain any further. However, to anyone to whom this is not clear.

As our factor  $v$  is obtained by multiplying the r.p.m. by the length of the circular path of the crank pin centre—or thus, R.P.M. × stroke ×  $\pi$  and the factor  $r$  is half of the stroke—it becomes evident that the smaller  $r$  is (given the same r.p.m.) the smaller will  $F$  be. I do not think it necessary to elaborate any further, as the reader can easily see this by substituting various figures. I do not think anyone can say I either thought wrongly, or even my use of the English language is unfortunate, as the whole matter is so simple. I have so much made a point that r.p.m. is the governing factor, and not  $v^2$ , that all I can think is that a deliberate misconception is being put on the article. For anyone to think that the factor  $v^2$  can be the same when r.p.m. are the same is unthinkable. However, to be quite clear, I once more repeat that r.p.m. are equal, as I have taken all through my article, this being perfectly clear in the calculation I made in my article, the velocity being in one case 30.9 ft. per second, and in the other 26.4 ft. We must assume an equal rise in r.p.m. at high speeds, i.e., one engine cannot be compared at, say, 3,000 r.p.m. with another at 1,500 r.p.m. Both must run at the same revolutions to make a fair comparison. I trust this point is now clear to Mr. Bonython, and that he can once more agree with me.

Mr. North’s letter is answered to a large extent with the other. With regard to the gudgeon pin pressure. As we may assume the pressures are equal in either case, we must see that the less distance the motion occurs through, the less will be the wear. For instance, if no motion occurs, no wear will take place. As far as taking a piece off the gudgeon pin bosses, this can be done to as great an extent on the bigger diameter piston, thus preserving its initial advantage of larger area.

The lubrication point I leave to your readers’ decision, but merely ask if the oil can reasonably be expected to splash as much up a small diameter long tube as up a large diameter and shorter tube. With regard to explaining carbonisation, as this can be caused by faulty combustion and other causes, e.g., closing the throttle with the engine in motion and drawing oil past the piston into the combustion chamber, I do not think it affects the case either way.

I do not think anyone can contend that a cylinder does not wear oval, I myself having come across numbers of old engines suffering from this. The wear always occurs on the front and rear walls, as any motor engineer of wide experience can vouch. Indeed, if I am not mistaken, I have seen in *The Motor Cycle* advice columns, on more than one occasion, complaints about this, and questions as to reboring. With regard to cylinder wearing large at the top, it naturally wears quicker where the lubrication is poorest. May I also add that piston ring wear is not very considerable, the pressure exerted by an average ring not being more than 10 lb. to 15 lb. per sq. in. The pressure of the piston on the cylinder walls is much greater than this on the explosion stroke.

In conclusion, as I have not noticed the usual disclaimer from either of the gentlemen who have written, might I venture to enquire if they, like myself, are totally uninterested parties in the making or selling of long stroke engines, or engines of any sort for motor cycles?

I must apologise for trespassing on your valuable space to such a great extent, but I think we may possibly learn a little from this discussion.

Bournbrook.

A.A.S.

# QUESTIONS AND REPLIES

A selection of questions of general interest received from readers and our replies thereto. All questions should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, London, E.C., and whether intended for publication or not must be accompanied by a stamped addressed envelope for reply. Correspondents are urged to write clearly and on one side of the paper only, numbering each query separately, and keeping a copy for ease of reference. Letters containing legal questions should be marked "Legal" in the left-hand corner of envelope, and should be kept distinct from questions bearing on technical subjects.

## Shorting the Plug Points.

**?** Is there a danger, if the plug points are set extra wide apart, and then become oiled or fouled up, of the current breaking down the mica insulator in order to find an easy path to earth?—S.H.R.

If the plug points become oiled up there is no risk of the current shorting through the insulation. No spark occurs at the points, simply because the burnt oil between the points makes an easy path for the current.

## Size of Jet for 3½ h.p.

**?** Would you kindly tell me what size of jet is necessary in a Senspray carburetter when fitted to a 3½ h.p. single, ridden solo with a variable gear.—J.H.

It is impossible to say what size of jet is required. The only way to arrive at the correct size is by experiment, as so many things affect the size of the jet, such as different valve timings, petrol levels, compression ratios, etc. Use as small a jet as possible, consistent with satisfactory all-round running; too large a jet causes overheating. If much too large, black smoke will come from the exhaust. The result will be fouled plugs, excessive petrol consumption, and loss of power. Too small a jet causes difficult starting, popping back through carburetter, refusal to take extra air, while the weak mixture resulting will also cause overheating, lack of power, and the engine will be difficult to start from cold.

## Brazing Materials.

**?** Would you kindly tell me what materials are needed for brazing, and how to proceed with the work? I have a powerful brazing blow-lamp.—H.A.

To make really satisfactory brazing jobs much skill and practice is required. The materials required are the following: A brazing lamp, forge, or blow-pipe large enough to supply plenty of heat. A brazing hearth, which, if a blow-lamp or blow-pipe is used, should be filled with asbestos cubes, or some material to concentrate the heat. Boron Comp. or some similar brazing flux, brazing wire, or spelter. The articles to be brazed should be cleaned bright and pinned together in the desired positions. The joints should then be heated in the forge, placing the asbestos cubes in position, so as to concentrate the heat to the best advantage. Apply the flux when red hot, and continue to heat until the brass spelter runs evenly around the joints.

## Difficult Starting.

**?** I have a 1914 single-cylinder motor bicycle, which is very difficult to start at times. When the machine has been standing indoors, I can start the engine up on the stand by pulling the back wheel round in top gear; I can also paddle it off when starting out for a ride, but when I have been riding a few miles, and then stop and allow the engine to cool down, I have a difficult job to get it to fire again, even by giving it an injection of petrol, or running by the side of the machine in bottom gear (11 to 1). The next day it will start quite easily again indoors. I have bound all carburetter joints with adhesive tape, and the plug sparks all right. I should be grateful if you would tell me the cause of this mysterious behaviour.—F.M.

The trouble is certainly difficult to diagnose. We should be inclined to think that it is caused by oil or condensation of moisture on the plug points. Try

slightly increasing the plug gap. If the machine is only difficult to start when warm, it is quite possible that the trouble is due to too large a jet, so that when warm the mixture is richer than when cold, and is just too rich to allow easy starting. If this be the case, slightly opening the air should rectify the starting, and of course injection would make matters worse.

## Belt Slip.

**?** I ride a 3½ h.p. single and sidecar, and in wet weather I am much troubled with belt slipping (an ordinary rubber belt is used). Will you please help me out of this difficulty? Raising the gear by means of the adjustable pulley does not make any difference, and there is never any slip in dry weather.—H.V.M.

You might try using a slightly larger belt, also see that the pulley flanges are true and made to the correct angle, viz., 28°.

THE UTILITARIAN SIDECAR.

The sidecar has been adopted for many and various purposes. We have seen machine gun motor cycles, sidecar ambulances, tradesmen's carriers, and now we have the field kitchenette and ammunition caisson manufactured by the Hendee Co. It has already done excellent service in the field on the Mexican border, we are told.

# A MILE IN 35 SEC.<sup>DS</sup>

## MOTOR CYCLE WORLD'S ROAD RECORD accomplished on WAKEFIELD 'CASTROL' MOTOR OIL.

On Saturday, October 7th, at Adelaide, Mr. Jack Booth, riding a 7 h.p. Indian, covered a mile on the road in the remarkable time of 35 seconds, equivalent to 102 MILES per hour. As usual, "Castrol" was the lubricant which was used.

"The Oil  
that  
circulates  
everywhere."

# MISCELLANEOUS ADVERTISEMENTS.

## PRICES.

**ADVERTISEMENTS** in these columns—First 12 words or less 1/6, and 3d. for every two words after. Each paragraph is charged separately. Name and address must be counted. Series discounts and special terms to regular trade advertisers will be quoted on application.

Postal Orders sent in payment for advertisements should be made payable to **ILIFFE & SONS Ltd.**, and crossed **& Co.**

All advertisements in this section should be accompanied with remittance, and be addressed to the offices of "The Motor Cycle," Hertford Street, Coventry. To ensure insertion letters should be posted in time to reach the offices of "The Motor Cycle," Coventry, or London (20, Tudor St., E.C.), by the first post on Friday morning previous to the day of issue.

All letters relating to advertisements should quote the number which is printed at the end of each advertisement, and the date of the issue in which it appeared.

The proprietors are not responsible for clerical or printers' errors, although every care is taken to avoid mistakes.

## NUMBERED ADDRESSES.

For the convenience of advertisers letters may be addressed to numbers at "The Motor Cycle" Office. When this is desired, the sum of 6d. to defray the cost of registration and to cover postage on replies must be added to the advertisement charge. Only the number will appear in the advertisement. All replies should be addressed, "No. 000, c/o 'The Motor Cycle,' 20, Tudor Street, E.C."

## DEPOSIT SYSTEM.

Persons who hesitate to send money to unknown persons may deal in perfect safety by availing themselves of our Deposit System. If the money be deposited with "The Motor Cycle," both parties are advised of this receipt.

The time allowed for a decision after receipt of the goods is three days, and if a sale is effected we remit the amount to the seller, but if not we return the amount to the depositor, and each party to the transaction pay carriage one way. For all transactions exceeding 10 in value, a deposit fee of 2s. 6d. is charged, when under 10 the fee is 1s. All deposit matters are dealt with at Coventry, and cheques and money orders should be made payable to Iliffe & Sons Limited.

The letter "D" at the end of an advertisement is an indication that the advertiser is willing to avail himself of the Deposit System. Other advertisers may be equally desirous, but have not advised us to that effect.

## SPECIAL NOTE.

Readers who reply to advertisements and receive no answer to their enquiries are requested to regard the silence as an indication that the goods advertised have already been disposed of. Advertisers often receive so many enquiries that it is quite impossible to reply to each one by post.

## MOTOR CYCLES FOR SALE.

### A.J.S.

A J.S., 6h.p., and coachbuilt sidecar, fitted with hood and screen, electric head lamps, in good condition; £72.—A. Downie, 19, Haymarket Terrace, Edinburgh. [5606]

1916 2½h.p. A.J.S., 3-speed, latest model, ridden 700 miles only, condition genuinely as new; specification as list.—Robinson's Garage, Green St., Cambridge. [5811]

A J.S. Late 1915 4h.p. Combination, hood, screen, lamps, horn, speedometer, leg shields, interchangeable wheels, first-class condition; £75.—J. C. Phipps, Stanton, Highworth, Wilts. [X2586]

1914 6h.p. A.J.S. Combination, in good condition, complete with all accessories; £60, or would accept smaller power machine and cash.—Williams, 19, Portland St., Cheltenham. [X2546]

1916 A.J.S. and Sidecar, 6h.p., only done 2,000 miles, perfect condition; cost over £115, electric lighting throughout, spare wheel, tyres unused, A.J.S. spring seat-pillar, many spares; price £95.—Pearce, Corn Exchange Chambers, Ipswich. [5685]

1916 2½h.p. A.J.S. Sporting Model, used 580 miles only, and complete with Lucas head lamp, tail lamp, Lucas horn, spare sprockets, spare valve, speedometer with maximum hand, etc., cost £70, condition as new; accept £56, or very near offer.—Layton's Garage, Bicester, Oxon. [X2688]

### Alldays.

COLMORE Depot, 31, Colmore Row, Birmingham, can supply immediately all models of Alldays Allon. [0796-]

ALLON, 1915/4, single speed, excellent throughout, lamps; offers wanted.—Arrowsmith, 21, Village Way, Beckenham. [5726]

ALLON, 1916, 2½h.p., 2-stroke, 2-speed, speedometer, electric lights, like new; £35.—29, St. Leonards St., Bow. [5759]

ALLON, 1916, 2-speed, 2-stroke, Lucas lamp and horn, tools, etc., as new; £38.—A. Downie, 19, Haymarket Terrace, Edinburgh. [5607]

ALLON, 1916, single-speed, practically new, best accessories; £29; seen by appointment only.—Boyce, Bank House, Cheam Rd., Sutton. [5821]

ALLON, late 1915, 2-speed, bought March, 1916, good condition, all accessories; officer going abroad; bargain, £32.—12, Wentworth Rd., Redland, Bristol. [X2661]

ALLON, 1916, 2-stroke, 2-speed, excellent condition, bought July, with all accessories, Dunlop tyres, P.H. lamp; £30.—22, Agaur Crescent, Stranraer, Scotland. [X2448]

ALLDAYS, 3½h.p., 1912 clutch model, engine, tyres, enamelling excellent condition, little used; a bargain, 20 gns.—Fairey, 23, Shaftesbury Rd., Ravenscourt Park, London, W. [5668]

ALLON, 2½h.p., 2-speed model, £44/2, or on easy purchase terms, deposit £11/0/6, and 12 monthly payments of £2/16/6.—Harrods, Ltd., Motor Cycle Dept., Brompton Rd., London, S.W. [5643]

ALLON, 2-speed, new June, 1916, auxiliary ½-gallon tank, lamp, horn, and usual tools, in excellent condition throughout, actual machine illustrated page 426, *The Motor Cycle*, November 16th.—Box 500, c/o *The Motor Cycle*. [X2134]

ALLONS, 12 models in stock, just arrived from works; deferred payments if desired, exchanges entertained.—Lamb's, 151, High St., Walthamstow, and at 50, High Rd., Wood Green. Tels.: Walthamstow 169, and Hornsey 1956. [5673]

### Ariel.

1912 3½h.p. Ariel 3-speed Combination; £28.—239, Liverpool Rd., N. [5799]

1917 Ariel, 3½h.p., 3-speed C.S., actually in stock.—Ross, 86, High Rd., Lee. [5782]

3½h.p. Ariel, free engine, good condition, new tyres; £18.—Lambert's, Thetford. [5823]

ARIEL, 3½h.p., latest 3-speed model, in stock, with or without sidecar.—Crow Bros., Guildford. [4962]

RIDER TOWARD, 78, High St., Hampstead.—1913 3½h.p., 3-speed Ariel, overhauled and re-enamelled, fast; 22 gns. [5868]

ARIEL, 3½h.p., semi T.T., with variable pulley gear, fast, most excellent condition; £24, bargain.—Layton's Garage, Bicester, Oxon. [X2685]

ARIEL, 1916, 3½h.p., 3-speed countershaft gear, lamps, horn, tools, etc., in use 8 weeks only, equal new; cost £69, sell £58.—A. Downie, 19, Haymarket Terrace, Edinburgh. [5608]

ARIEL, 1913, 3½h.p., 3-speed combination, guaranteed perfect order, complete with head and rear lamps, apron, carrier, etc.; great bargain, lowest £27/10.—Ellis, 560, Lillie Rd., Fulham, London. [5656]

I CAN Give immediate delivery of 1917 5-6h.p. Ariels, 3½h.p. Ariels, solo or combinations; also 1916 5-6h.p. combination as new, guaranteed, £80; exchanges or deferred payments.—Jones, Garage, Broadway, Muswell Hill. [5192]

## MOTOR CYCLES FOR SALE.

## Ariel.

**C**OLMORE Depot, 31, Colmore Row, Birmingham, have in stock for immediate delivery all models of Ariel motor cycles, with or without sidecars. [0797]

## Auto-Wheels.

**A**UTO-WHEEL, B.S.A. de Luxe, perfect condition; £7/10.—Bishop Kingsbury, Martock. [5611]

**A**UTO-WHEEL, 1915, like new; £11, or exchange.—W. and H. Motor Co., Ltd., 287, Deansgate, Manchester. [5806]

**A**UTO-WHEEL, 1916, in new condition, hardly used; real bargain, £9.—Groves, 27, Tyson Rd., Forest Hill. [5765]

**S**EVERAL Genuine Auto-Wheels, late models, absolutely as new, from £7 to £10 each.—Murray's, 37a, Charles St., Hatton Garden, Holborn. [X2624]

## Bat.

**B**AT-J.A.P., 1913 6-7 h.p. twin, Bosch; must sell; £19/10.—1, Ebner St., Wandsworth. [5840]

**8** h.p. Bat, 2-speed, chain drive, Mills-Fulford C.B. sidecar, perfect order; £55.—Smith, Plumber Wivenhoe, Essex. [5698]

**B**ATS.—P. J. Evans, Birmingham agent.—Immediate delivery 4-5 h.p. sporting model, 2 speeds; £63/15.—87-91, John Bright St., Birmingham. [X2593]

**N**EW Bat-Japs, very latest model, in stock; 4-5 h.p. 2 speeds and free engine; £63/5; exchange or easy terms.—Wanchope's, 9, Shoe Lane, London. [5831]

## Blackburne.

**19** 15 Blackburne Combination, only done 1,200 miles, perfect condition, lamps, horn, speedometer, wind screen, new tyres, 3 speeds; any trial; sacrifice £55.—Island, Compton, Guildford. [5595]

**B**LACKBURN, 1916, 3 1/2 h.p., 3-speed countershaft gear, Lucas lamp, horn, tools, etc., fitted with torpedo coachbuilt sidecar, fast sporting outfit, only done 300 miles, condition as new; £72.—A. Downie, 19, Havmarket Terrace, Edinburgh. [5609]

## Bradbury.

**F**OR Sale, Bradbury and sidecar, N.S.U. 2-speed, fine order; any trial; £27, or nearest offer.—8, Castleford St., Chadderton, Oldham. [X2494]

**B**RADBURY, 1912, 4 h.p., N.S.U., capital case sidecar, good spares, splendid engine, 90 m.p.g.; £24.—T.F.B., 2, Alcester Rd., Wallington. [5683]

**B**RADBURY, 1915, 4 h.p., coachbuilt sidecar, 3-speed gear box, h.b. clutch, lamps, horns, etc., splendid condition, little used, £50; also 3 1/2 h.p. 1913 New Hudson, 3-speed, clutch, coachbuilt sidecar, lamps, nearest £40.—Beever, Station Rd., Holmfirth. [X2696]

## Brough.

**B**ROUGH, 1915, 3 1/2 h.p., flat twin, T.T. model, 2-speed countershaft, very fast and powerful, all accessories, including speedometer, perfect condition, unspratched; £40.—C. Hurlock, 63, Denmark Hill, S.W. [5725]

## Brown.

**B**BROWN, 3 1/2 h.p., in absolutely perfect condition; £23.—W. and H. Motor Co., Ltd., 287, Deansgate, Manchester. [5341]

**B**BROWN, 3 1/2 h.p., sound order, good condition, good tyres, and fast; £5.—Head, 51, Hainthorpe Rd., West Norwood. [0668]

**R**IDER TROWARD, 78, High St., Hampstead.—1913 T.T. Brown, 3 1/2 h.p., re-enamelled, overhauled, pan saddle; 16 gns. [5863]

## MOTOR CYCLES FOR SALE.

## Rex.

1913 Rex, 4 h.p., 2-speed, free engine, and sidecar; £35, or offers.—194, Shrewsbury Rd., East Ham, E. [5702]

1910 3½ h.p. Rex, Bosch, spring forks, dropped frame, new Clinchers; £12/10.—248, Bentley Rd., Doncaster. [X2679]

REX 1912 6 h.p. Combination, 2 speeds, free engine, handle starting, good order; £25.—Pinstow, Grimsby. [X2611]

REX, 6 h.p., and sidecar, 2-speed, accessories, perfect order; £23, or exchange.—80, Palatine Rd., Stoke Newington. [5729]

REX 5-6 h.p. Twin, clutch model, tyres and Service belt new, in fine order; £17.—14, Dodbrooke Rd., West Norwood. [0873]

REX, 3½ h.p., mag., spring forks, re-enamelled, good tyres, in good order; £10.—Head, 51, Hainthorpe Rd., West Norwood. [0869]

REX, 3½ h.p., enamel and plate as new, good tyres, Bosch, Senospray, all accessories, must sell, £12; also sidecar, 50/—1, Boswell St., Radford, Nottingham. [5735]

4 h.p. Rex, 1912 model, and sidecar, N.S.U. gears, clutch, Jones speedometer, ready to ride away; owner joining up; £25/10, or near offer.—Alcock, 103, Rosebery Av. [5679]

REX 7 h.p. Twin, handle starting, £23/10; 1913 6 h.p. 2-speed Rex Sidette, £36/10; 3½ h.p. magnet model, £14/10; 5½ h.p. twin, £13/10.—Motor Exchange, Horton St., Halifax. [5480]

REX, 1912, 6 h.p. twin, 2 speeds, C.B. sidecar, B. and B. carburettor, Bosch mag., 3 lamps, complete with accessories, spare inner tubes; £40.—5, Wigan Rd., Skelmersdale, Ormskirk. Photo, any trial. [5612]

5-6 h.p. Twin Rex, Bosch mag., free engine, variable pulley, excellent condition, carefully used, recently overhauled by expert, new rings, valves, springs, bearings, Avon tyres; £30, or nearest offer; exchanges entertained.—Discharged, Glen-Garth, Grove Rd., Fishponds, Bristol. [X2652]

## Rover.

ROVER, 1917 models in stock.—Lambert's, Thetford. [5825]

ROVER, new 1917 latest combinations, solo, and T.T. models in stock.—Moss, Wem. [X2614]

1917 3½ h.p. 3-speed Countershaft Rover; £69.—Wilkin and Co., Hunters Bar, Sheffield. [X2630]

1915 Rover Combination, 3-speed gear, excellent condition throughout; £47/10.—Hayes, 344, Easton Rd., N.W. [X2704]

ROVER, T.T., 1915 model, Philipson, pulley; price 40 gns.; smart, fast, and guaranteed mechanically sound, fully equipped.—Wanchope's, 9, Shoe Lane, London. [5833]

1917 Rover Combination, brand new latest model, with all latest improvements; £89/9; willingly entertain Douglas in exchange.—Robinson's Garage, Green St., Cambridge. [5809]

ROVER Combination, 1914, excellent condition; will dismantle for inspection by arrangement, and will give buyer an afternoon with same; what offers? must sell.—98, Kinveachy Gardens, Charlton, S.E. [5613]

P. J. EVANS, sole Birmingham Rover agent.—Immediate delivery 1917 T.T. semi-T.T. models, with or without Philipson, also latest countershaft models.—87-91, John Bright St., Birmingham. [X2589]

## Royal Ruby.

1914 Ruby 2-stroke, guaranteed perfect; £14.—20, Whitely St., Reading. [5851]

RIDER TROWARD, 78, High St., Hampstead.—1915 Royal Ruby, 2-speed, 2-stroke; 21 gns. [5877]

1914 2½ h.p. Royal Ruby, 2-stroke, perfect; £17, or very near offer.—248, Bentley Rd., Doncaster. [X2675]

ROYAL Ruby, 1917 model, just arrived, single speed, £32/10, 2-speed £40; deferred payments and exchanges. See our name on outside cover of this issue.—Lamb's 151, High St., Walthamstow, and 50, High Rd., Wood Green. Tels.: Walthamstow 169, and Hornsey 1956. [5666]

## Rudge.

1915 6 h.p. Rudge Multi, sound order; cheap.—Lambert's, Thetford. [5827]

3½ h.p. Rudge Multi; £60; cash or easy terms.—R. E. Jones (Garages), Ltd., Swansea. [0864]

1912 3½ h.p. Rudge, free engine, good condition; £25.—R. E. Jones (Garages), Ltd., Swansea. [0785]

1912 3½ h.p. Rudge, clutch model, splendid condition; £22.—Wilkin, Hunters Bar, Sheffield. [X2635]

3½ h.p. Rudge Multi, 1914, lamps, Stewart horn, good condition; £32.—Milton, 1, Sandbeck Place, Endcliffe, Sheffield. [5653]

1913 Rudge, fitted with N.S.U. 2-speed, in perfect condition, except belt; £28/10.—Horswill, 103, Brook St., Chester. [5632]

1913 3½ h.p. Rudge Multi and coachbuilt sidecar, lamps, horn, and speedometer; £35.—Wilkin, Hunters Bar, Sheffield. [X2634]

RUDGE Multi, 1913, 2 new tyres, 2 new belts, lamps, etc.; £29; Watsonian sidecar to fit, £2/10.—Box 530, c/o The Motor Cycle. [5722]

## The Question of Exports.

**A**N Italian correspondent, in a letter published in the present issue, takes up the important question of British trade Overseas. It will be recalled that the Wulfruna Engineering Co., Ltd., following upon the recent manufacturing prohibition Order, complained to the Ministry of Munitions that, unless it were possible to obtain permits to manufacture motor cycles freely, it would mean losing important British trade in foreign markets, to the direct benefit of neutrals. The company rightly considers the matter of vital importance, inasmuch as an established trade in which British manufacturers held supremacy is at stake. Though the matter is one concerning the trade in particular, it is no new subject to our readers. In the early part of the year we collected the experiences and opinions of manufacturers on this subject of Overseas trade, and submitted to the Board of Trade a list of the difficulties and obstacles in the way of maintaining exports. The outcome was an official foreshadowing of improved conditions for export. Things move quickly, however, in war time, and it is impossible for anyone to anticipate what may be the state of affairs more than a few months ahead. We are in the hands of the authorities, and so long as it is realised how our motor industry is being jeopardised by insurmountable obstacles, there seems nothing to be done. It is extremely galling to British manufacturers who are in a position to assemble motor cycles without hindering the output of munitions to be unable to devote their energies to Overseas trade owing to the three-fold difficulties of obtaining licences to export, transport to the docks, and the scarcity of shipping space available. Great Britain's grip is being gradually lost in markets where we have hitherto held sway, and it is obvious that, once other countries get established in our markets, it will take many years for us to regain our old position. In support of our Italian correspondent's remarks, we quote the following cable

published broadcast in the daily press last week:

During the last three years Australian trade with America has increased by 500%, or in money value by £9,004,000. The balance of trade between the two countries has been reduced from 59% to 4% in favour of America.

## The Motor Cycle as an Alternative to the Train.

**T**HREE separate appeals have now been issued by the Board of Trade to avoid in every case possible unnecessary journeys by train. As to whether "unnecessary" journeys are made nowadays the Government probably know best, and such would be indefensible, but the recommendation calls to mind a point we have advanced on several occasions during the war, and that is that travelling by motor cycle is cheaper, healthier if the weather be good, and often more convenient than journeying in a train.

Motor cyclists would readily resort to their machines for necessary journeys in preference to travelling by rail if that alternative were made easier. It is regrettable, however, that petrol supplies are not only exceedingly expensive, but difficult to obtain, except in small quantities, and the position, therefore, becomes difficult whichever course one may decide to adopt. It is mentioned in the Order that "the Government would be reluctant to take any steps in the direction of a general interference with railway travel, and the possibility of any such action may be made more remote if members of the public will individually bear in mind that every journey not of genuine necessity should be avoided in the interests of the country." The inference of the Government announcement is that we should adopt other forms of conveyance, and we appeal on behalf of motorists—particularly motor cyclists, who use the most economical form of motor vehicle—to render the change easier. For a start, petrol should be readily forthcoming, and at a figure which approximates more to the pre-war level.

## An Italian Motor Cycle Hospital.

A Military Workshop for Disabled Mounts.

Repair workshops—where every part of a motor cycle can be replaced—are situated relatively close to the firing line, thus enabling motor cycles which are only slightly damaged to be put into commission again with a minimum loss of time. The Italian equipment enables even accessories to be rejuvenated.

**M**OTOR cycles play an important role in the prosecution of the war on the Italian front, as they do in all the zones of war, and the photographs we reproduce show the central repair depot, where more than 300 men are employed in renovating or dismantling motor cycles that have received a temporary quietus, maybe by a shell or skid, or through an unruly lorry, but seldom by ordinary wear and tear.

At this depot almost any kind of repair is undertaken when it is found that the machine is worth it. Everything that it is possible to renovate is renovated. Even lamps and horns are repaired, besides sparking plugs and magnetos. The whole workshop is fitted up on most modern lines, and quite complete and independent. There are a foundry, vulcanising plant for tyres, plating, and enamelling

departments, as well as the special magneto and sparking plug repairing shop. If a machine is found to be unserviceable it is entirely dismantled, and all parts that can be of any further use put on one side for repairs to other machines of the same make.

Older and miscellaneous models of machines that were requisitioned at the beginning of the war, however, are gradually eliminated when badly damaged. All machines that leave these workshops after being repaired are completely enamelled the grey-green shade which is the official colour for all vehicles in the Italian Army.

At these stores there is usually a big stock of new machines—Triumph, Sunbeam, Douglas, Bianchi, Stucchi, Frera, and Excelsior motor cycles are among the models represented.

(1) The erection shop. An Italian Bianchi and an American Excelsior motor cycle are in the foreground.

(3) Store room for spare parts.

(2) A workshop of electricians, where magneto overhauls and repairs are effected.

(4) Frame building and repairs department.

### Engine Balance of Two-strokes.

One of the factors which classifies baby two-strokes as good, bad, and indifferent is engine balance. Some of these machines vibrate almost as badly as a reaping machine, despite their even torque; others run almost as smoothly as a steam engine or a good flat twin. It is a little difficult to be sure whether the vibration emanates from the engine or from the road, as some of them have very whippy frames of crude design; but the point can always be determined by testing the machine on a bit of first-class surface. These lightweighters are peculiarly sensitive to tyre pressures; an uncomfortable machine can be transformed by running the back tyre just less than board hard, and the front tyre so soppy that the rims just do not indent the tube, though this latter pressure is, of course, too low to get a very long life out of the front tube and cover. Riders accustomed to heavyweights usually pump up the back tyre until they are tired, and the front tyre until it just yields a trifle to knuckle pressure; these inflations are excessive for baby mounts. In any case it is folly to purchase lightweighters without a trial; they vary excessively in merit, and no factors differ more upon baby two-strokes than engine balance and frame rigidity.

### From the Front.

My postbag from "somewhere in France" continues to bring assortments of interesting letters. Bernard Siffken, who owes his motor enthusiasm to catching sight of our "pretty blue cover" on a bookstall in 1904, pleads for a new type of D.R. machine. He thinks the D.R. work demands a light, handy machine on  $2\frac{3}{4}$  h.p. Douglas lines, but that the ideal mount won't be with us until light machines can be built much more substantially than is at present possible. Riders prefer the lightweight for short-distance military work on convoy-crowded and shell-shattered mud tracks, because it is so manageable. On the other hand, it wags its tail more than the heavyweights, because its frame is less rigid; and it is apt to give trouble on long fast runs in France, because the roads produce so much vibration. This is largely a question of metallurgy. The gear boxes of prehistoric cars were fitted with colossal pinions; as time went on, the weight of these pinions was quartered, and their strength was quadrupled. Some day we shall get 100 lb. lightweighters as sturdy and as powerful as a 250 lb.  $3\frac{1}{2}$  h.p. machine of to-day; but we must wait till the steel chemists have made a little more progress. Capt. Lindsay is still pegging away at the plug question, and is rather surprised to find that he can "dry up" his W.D. Triumph in less than two miles of speed with an aeroplane plug installed. It is surely obvious that an aeroplane plug works under tolerably favourable conditions; the minimum speed of the plane may be 45 m.p.h., or even more, so that a

terrific cooling draught is assured. I should guess that pains are taken to produce super-plugs for aeroplanes rather because the consequences of failure are so disastrous than because the working conditions make for overheating. The plug surely has a much worse time on a W.D. Triumph scrapping on the flat with a top gear of  $5\frac{1}{2}$  to 1?

### Three Mounts Compared.

Last week I had occasion to make an eighty-mile run thrice over in cold, frosty weather, the route including the crossing of a very bleak exposed moor. I chanced to use three separate motors for the three trips, viz., a 10 h.p. racing light car, a  $3\frac{1}{2}$  h.p. flat twin, and a baby two-stroke. The latter provided the most comfortable journey, partly because it proved to be the handiest vehicle on the congealed grease, partly because its pace did not create draughts capable of piercing my thick winter clothing. The light car, much to my surprise, caused me the maximum of discomfort; its narrow windscreen diverted a piercing draught on to my right hand, which nearly got frost-bitten; and this one cold spot in my anatomy raised profound sympathy with the feeling of a standard petrol engine, having a hot spot down one side owing to the presence of its exhaust valve. The flat twin was more comfortable than the light car, because I was evenly cold all over, and so was not distracted by one acutely chilly spot in my body; incidentally, it was very easily the fastest over the route. There was no reason why I should not have throttled it down to the average of the baby two-stroke, but I was mentally incapable of averaging 18 m.p.h. on a machine capable of averaging 40 m.p.h. I wore the same clothing on all three runs, and I now take out the baby two-stroke for all solo work in very bleak weather.

### Flat Twins Don't Gum.

I am middle-aged and lazy. My horizontal twin must weigh about 3 cwt. Yet it is the simplest matter in the world to paddle it off from stone cold on a gear of  $9\frac{1}{2}$  to 1—so simple that I had just as soon start it this way as by the kick-starter. What about gumming? will be the natural enquiry of every owner of a vertical single or a V twin. The owners of flat twins will all have noticed how free from gumming this type of engine is; and the facts suggest that what most of us call "gumming" and are accustomed to remedy by petrol injections (did not our makers fit little leaky tank spouts for the express purpose to the vertical and V engines which we last rode?) was really metal friction, due to the lubricant having drained down off the cylinder walls whilst the machine was standing? I must get hold of a vertical single, and see whether injecting a charge of oil and revolving the engine a dozen times does not free it quite as efficiently as a petrol injection.

## A THREE-PURPOSE SIDECAR.

IT is no new thing to use a sidecar for the purpose of transporting the sick and wounded; many such outfits have been designed during the last few years and have proved themselves to be very serviceable. Nor is it unusual to use a sidecar on a camping trip, for it lends itself well to carrying the necessary apparatus. However, a sidecar specially designed so as to be suitable for both these purposes as well as for ordinary driving and touring has not, we believe, previously been constructed.

The T.M. combination, which we illustrate and describe on this page, combines the necessary requisites for these various functions in a very ingenious manner. The sidecar body, which is very roomy, is divided into three compartments.

### The Portmanteau.

The underneath compartment, or boot, is designed to receive the portmanteau, which consists of a case made in two parts and hinged together so that when opened out it can form a bed or an operating table. The drawers in the one portion can then be opened from the side or the whole lid turned back. The other portions may contain blankets, clothes, or other articles. In the toe are two lockers, of which the bottom one is intended to carry two Primus stoves, tools, paraffin, etc., while the upper locker is for food.

The hood is constructed to be used in different positions, so as to cover any person riding or sleeping in the sidecar, or, when used as an ambulance, to shelter the patient from the elements. When the portmanteau is not in position, part of the floor can be taken out to form a table top. A second seat can be fitted.

The back of the body can be let down into any position that may be convenient.

### The Stretcher.

A folding stretcher is provided which, when folded, fits into the body of the sidecar. This is furnished with wheels, which also fold up under the stretcher, and when not employed in its ostensible purpose can be used as a bed for a camper, second and third beds being provided by the portmanteau and the sidecar itself. Thus none of the three

The T.M. combination as it appears on the road.  
The portmanteau unfolded and used as an operating table.  
Placing a wounded man into the sidecar on the stretcher.

## A COMMODIOUS OUTFIT DESIGNED FOR CAMPING, AMBULANCE WORK, OR TOURING.

passengers need sleep on the ground itself. Three mattresses are also part of the equipment.

### The Sidecar.

The sidecar body is so arranged that a child as well as an adult passenger can be carried comfortably. The outfit can thus accommodate no fewer than four passengers. Also several cans of petrol can be placed in the boot without opening the door at the back. It will be seen, therefore, that the T.M. combination will make an admirable family vehicle suitable for every purpose to which such a conveyance is usually put. Room is found also for the usual paraphernalia of a camping tour.

### The Tent.

The tent, when erected, is composed of two compartments, separated by a curtain, and is large enough to contain the bicycle and sidecar as well as the rider and passengers. The entrance is closed by flaps, not shown in the photograph. The telescopic tubes on which the tent is erected were first carried in rectangular form around the sidecar, but this arrangement has now been improved upon by so constructing them that they can be placed in a bundle between the sidecar and cycle. Although the whole forms a combination, the parts have been patented separately by W. A. Mercer and A. Timpé, since they can be used independently of each other.

### Ambulance Sidecars.

While on the subject of sidecar ambulances it may be mentioned that, while many are privately employed in this country, the British Red Cross Society does not employ them, nor are they used by the War Department. They are, however, used with success by the French authorities, and a certain number are in use on the Italian Front, where they are quickly proving their value as an expeditious method of carrying a wounded man.

Apart from the use of the sidecar and tent for ambulance work, their use for touring purposes would be fully appreciated, especially by the family man. When a small child is taken the length and flatness of the sidecar enables it to be laid flat at the bottom of the car instead of always being carried on the passenger's knees.

Asleep in the sidecar.

Side view of the tent.

# The Double Acting Two-stroke Engine.

A Design sometimes known as a One-stroke.

THE announcement in a recent issue of this journal that a reader had designed a one-stroke engine has apparently caused interest among inventors, for since then we have received several suggested designs which are intended to be included under this heading. The designs are interesting, and in some cases ingenious, but the question arises whether the title, "One-stroke Engine," is really applicable to any of them. "Double acting two-strokes" would seem to be the term which describes them better. "One-stroke" seems no more applicable to these designs than to the four-cylinder engine, or two-cylinder two-stroke, for, although an impulse is transmitted to the crankshaft every half revolution or stroke, a double-ended cylinder is necessary in every instance, which, of course, occupies a considerable length, and might reasonably be compared with a two-cylinder horizontal twin. Then, again, in every instance a pump of some description is required, and as in all the designs, but one, this is in the form of a pump cylinder, the numbers of moving and reciprocating parts are no less, and in some cases rather greater, than in the two-cylinder two-stroke already known; whilst the efficiency of the so-called "one-stroke" is likely to be considerably lower than in the two separate cylinder two-stroke type.

## Some Working Difficulties.

Interesting though these designs are, a number of points crop up which would prevent their practical use. The greatest of these is overheating, which would most certainly occur, and which would necessitate water-cooling.

A "one-stroke" engine designed by "Dixie" (referred to in the article).

## An Overseas Design.

Among the numerous designs submitted, probably the most practical is that sent by Mr. G. B. Martin, jun., of Pretoria, South Africa. This engine is very similar to the double acting two-stroke design which appeared in our issue of March 30th in its general outlay,

Design for a double-acting two-stroke engine by G. B. Martin.

but, whereas in that design two exhaust ports, two inlet ports, and two transfer ports were required, Mr. Martin's has common ports for both ends of the cylinder.

The working is briefly as follows: D is a light pump made of thin material attached to the cylinder E, A is the induction pipe from carburetter, B is the inlet port to cylinder and serving both N and O, F and G are automatic valves in transfer ports from pump, C is exhaust port common to N and O, and K and J are sparking plugs. The cycle of operations is as follows: The piston in pump D has ascended to L, thereby causing a partial vacuum until the automatic valve in A is uncovered, when a sudden charge of gas is drawn into M; at the same time an explosion occurs at O, caused by the ignition of gas drawn in on a previous cycle. The double-ended piston is now forced up to N, thereby causing piston in pump to

descend to M, at the same time compressing gas (which now closes valve in A) until the port B is uncovered by the piston on its travel to N, when the gas passing through the valve F in a compressed state is deflected by the shape of the piston to O, and forces out the exhaust gas through C.

A very similar design to Mr. Martin's is submitted under the pseudonym "Dixie." In this the transfer valves are of the slide valve variety, and operated by an eccentric similar to a steam engine; otherwise, as will be seen from the sketch, the working is identical with Mr. Martin's, common ports also being used.

## Rotary Pumps.

In a design submitted by Mr. G. S. Moores, an enthusiastic nineteen years old Bristol motor cyclist, the common port principle is again adopted, but no valves are used, the piston acting as a slide valve, as in the usual two-stroke. This design utilises two rotary pumps, one for scavenging and one for forcing the fresh charge into the cylinder. The working of this design is as follows:

A is a common cylinder with both ends closed, whilst two exhaust ports B and an inlet port C are uncovered, as in usual two-stroke design. The piston D is also closed at either end and connected with a shaft E, which slides up and down in a packed gland F. The mixture is drawn from the carburetter by the rotary pump H and pushed into an auxiliary cylinder I fitted with a non-return valve J. Thus while the inlet is closed, the pump still compressing the mixture, the gas immediately enters the combustion chamber on the opening of the inlet port C, followed by compression and explosion, and is finally drawn out by the vacuum caused in the exhaust system by the working of the rotary pump K.

A double-acting two-stroke engine designed by Mr. G. S. Moores.

## WINTER HINTS.

### HOW TO PREPARE A MOTOR CYCLE FOR USE IN BAD WEATHER.

By H. MORTIMER BATTEN

**A**N afternoon spent in preparing one's machine for the rainy winter months cannot be regarded as idle time, for with a little preparation for the mud and slush a fair sum can be saved in the way of depreciation. The great thing to remember during the wet weather is that one has a cycle to look after in addition to a motor. The cycle parts of the machine are far more susceptible to wet and mud than is the engine, and unless something in the way of preparation be made for winter riding one must expect rapid deterioration—wear of controls, wheel bearings, spring forks, and general lack of lustre.

As regards the wheel bearings, steering head, and spring forks, one cannot do better than buy a grease gun (preferably with screw-down plunger), and use Price's hub lubricant. Both the gun and the lubricant can be purchased from an accessory dealer in almost any town. Fill the hubs till the lubricant squelches out from the cups on either side, as this overflow forms a more or less waterproof pad which prevents foreign matter working into the hubs. Repeat the dose perhaps once a fortnight, allowing the grease to squelch out each time, as by doing so it carries with it any fine grit that may be in the act of entering the bearing. Do not clean the hubs during the winter; it is not worth while, and by so doing you are likely to force grit into the crevices. More hubs give out through over cleaning than by neglect.

#### Leg Shields.

A winter mount that does not possess leg shields is like a retired uncle without funds. It is an iniquity. I think the time is drawing near when every rider will demand, with his new mount, a set of shields for winter riding. Personally I make a point of writing for these whether or not the makers supply them, and I think that the characteristically thorough and thoughtful British manufacturer will in due course follow the example of the few firms that have already fallen into line.

#### Ever-useful Insulating Tape.

If I were asked which I would rather forego for the winter months, my muffler or my insulating tape, I think I should toss for it. Three articles reside side by side in my motor house as the indispensable necessities of winter—a

force-feed oilcan, a grease gun, and a large roll of insulation tape. And when the creeper on the wall begins to shed its leaves I start off with the insulation tape by binding the h.t. wires to the frame in such a way that they will collect as little moisture as possible. Trouble is very often caused by the wires becoming saturated, or by water streaming down them and draining on to the plug or into the magneto. Inconvenience in this direction can be avoided by thoughtful use of the tape, and, if possible, arrange the wires so that the drip they accumulate would have to run uphill half an inch or so before it could reach the magneto.

#### Take Care of Bowden Controls.

Now to turn one's attention to the Bowden wires, which require very special attention. Neglect of these and one will experience, next spring, the annoyance of broken strands, which prevent the

controls from working, and which draw blood from one's thumb when one attempts to persuade them into the right and narrow way.

We must economise, and if given proper attention the Bowden controls should last indefinitely. A single winter of neglect, however, means their ruin. If the wires are of the preferable waterproof cover type, mix a half and half solution of petrol and vaseline in a small oilcan, and, holding the end of the wire vertical, work the solution through the casing by injecting it drop by drop. This should not, of course, be necessary with the waterproof controls, but I have found it pays, because the waterproof cover invariably becomes damaged at certain points. The petrol evaporates and leaves

only the heavy grease in the casing, thus preventing rust. One dose of lubricant is sufficient for the winter.

Make sure the outer case is sound. Probably it has been trapped at one or two points and the waterproof cover damaged. Bind the wire with insulation tape at all such parts—not only to the frame, so that it cannot be trapped again, but also in a way that will prevent water working in at the wound.

It is as well, while at it, to secure the wire tightly to any point at which it passes over a sharp edge, as this will prevent movement of the outer casing, and thus eliminate wear caused by friction against the edge.

#### Handle-bars.

I think it a very good plan to bind one's handle-bars from end to end for the winter—more insulation tape, please! By binding the bars from end to end with tape we not only preserve their virgin lustre, but also we protect the cable controls at the point where they are most exposed. Bind the cables securely to the bars, and, instead of slopping down and trapping themselves in the forks, they will stick straight out forward, and thus assume a natural downward curve out of harm's way.

If the wires are of the alleged internal variety, without waterproofing, deluge the casings with oil, as only this will save the inner cable from rust at the points where the wires are inevitably exposed to the atmosphere.

#### Sparkling Plugs.

Some sparking plugs are likely to give trouble after a machine has been left standing in the rain. I think those with fat insulations are the best for winter use, but it is very difficult to stop a wet plug from short circuiting. After trying various home devised overcoats for the plugs I have come to the conclusion that a handy duster, for wiping the plugs and the wires, is the simplest method.

#### Carburation.

We may hopefully anticipate starting difficulties during the coming winter. I think I shall resort to the baby two-stroke, and see that the kettle is on the kitchen bars ten minutes before starting. It is to be hoped, however, that culinary equipment will not always be necessary.

Fit a hot air intake, and look out for air leaks! Run the engine, and go over

**Winter Hints.—**

all the joints with an oilcan. If there is the faintest suggestion of a leak, drop seccotine over the suspected joint while the engine is ticking over. The vacuum in the induction pipe will draw the seccotine well into the joint, and when next a test is made probably no leakage will show.

**Multiple-jet Carburettors.**

A hint here as regards starting with carburettors of the above type—such as the Binks. It is of no use flooding the carburettor with the handle-bar lever at the usual starting point, as in this position only the pilot is uncovered. Thrust the throttle lever fully open and then flood, whereupon all three jets will spurt petrol—sufficient to flood the whole induction pipe with gas. Then close the

Showing where the Bowden wires should be protected by a binding of insulating tape to prevent wear on a rough edge.

throttle, so as to shut off the automatic air supply, and start in the usual way at pilot opening.

**Belts.**

As regards wet weather use, many chain-cum-belt machines exhibit a sur-

prising degree of thoughtlessness on the part of their designers. Very often the back mudguard is cut to admit the belt at a point which intercepts the whole flow of drip from the guard, which is thus concentrated upon the belt. On some machines the back guard might have been designed with a view primarily to keeping the belt well watered, and the only course is to make the best of things or buy a new guard, after pouring one's vitriol wrath upon the makers. By judiciously shaping the guard with a pair of square-nosed pliers, the iniquitous flood can sometimes be diverted in such a way as to postpone the period of belt slip.

**Plated Parts.**

Plated parts are not half so bad as we sometimes like to suppose, but they savour more of summer plumage than of winter usefulness. Stove enamel, thinned down with petrol, is a useful and not unsightly winter black, which can easily be rubbed off next spring with a cloth soaked in paraffin. It dries almost instantly, and a tin of it kept handy and applied with a thin brush where a spot of rust appears preserves appearances wonderfully.

**Lamps.**

Drain your generator with the valve turned full on every time you remove the lower portion to refill with carbide. Keep your tube lengths as short and neat as possible, and bind the joints with a twist or two of tape to prevent perishing and cracking. As regards the tail lamp, arrange the tube so that there are no low points in which water can accumulate. Do not try to revive an

exhausted generator by turning the water fully on, or you may experience trouble next time.

**Clothing.**

Really good, well-lined overalls, made of some soft material, and worn under a long tarpaulin coat, make the best motor covering. Suits are rather costly, and by wearing a tarpaulin over them

Bowden wires made to assume a natural curve out of the way of the forks.

one not only keeps warm and dry, but saves the suit from those periodical drenchings which ultimately spoil its shape and wearing qualities.

There is nothing to beat the strong tarpaulin coats such as seamen wear.

The slip-on tarpaulin leggings are exceedingly useful, and if these garments prove a shade stiff when new, they relax immediately if held before the fire previous to donning.

## THE CHEAP MOTOR CYCLE.

### A Reader's Ideas on Quantity Production.

AN interesting question relating to the production of cheap motor cycles is raised by a correspondent, whose letter we give in full on this page. We have tentatively touched on the subject once or twice recently, and although it is impossible that capital could be obtained for such a venture for many a long month to come, there is at the same time a distinct possibility that "quantity" production will be a necessity in the future, especially if our manufacturers intend competing for the world trade.

"Sir,—Two paragraphs in your issue of October 19th open a field for interesting discussion. The first is that in 'Ixion's' 'Occasional Comments,' on page 331, under the heading 'Mutatis Mutandis'; the second, that on page 342, entitled 'More Cheap Cars,' in which the opinion is expressed that 'we do not think cheaply manufactured motor cycles would benefit motor cycling in England, though it might for a period popularise it.'

"In connection with the latter paragraph, it is only right to demand what standard should be taken as a criterion of cheapness. We are told by 'Ixion' that America's best 7 h.p. sells at £55 in the States—a price some pounds below that asked for a first-class British single-cylinder machine.

"There is surely some fault in British

organisation, even if we accept either the British or American standard of cheapness in our comparison, and allowing for differences on account of the extra attention paid to finish in this country.

"One factor of considerable moment would seem, in my opinion, to be ascribable to lack of specialisation in repetition work, and desire to secure big dividends at the expense of the rider. The British rider prefers to trust to a machine that has gained a reputation for workmanship and appearance, forgetting, as 'Ixion' points out, that this fetish is not a factor of prime importance. A machine gets a reputation for these qualities, and the buyer will have it at any price, much to the satisfaction of the profit-maker, who pockets large dividends and gains a reputation based on judgments that are dictated by fancy rather than sound reasoning.

"If motor cycling can be popularised by cheapening machines, by all means let us have cheap machines, provided reasonable attention is paid to workmanship and efficiency of vital parts, and less to appearance. It is only the finicky rider that sets undue store on the finish of his machine. The man who wants a motor cycle for the purpose for which it is created is content if balance is observed in the constructional features and finish.

"It is both amusing and irritating to find how the maker who is obsessed with the 'appearance' mania neglects many of the minor points which make for the comfort and pleasure of the rider. Although an improvement is becoming manifest, it is annoying to find many small parts fixed by miserable little grub screws and nuts which no standard spanner will fit. Why cannot some system of standardisation be adopted? And what does such a body as the Engineering Standards Committee exist for? Of course, it is to the advantage of the maker to have his own special spanners and other tools, which the cheerful rider purchases from him.

"I am a keen motor cyclist, and will continue to be so in spite of the drawbacks I have mentioned; and, provided the public can purchase a machine of reasonable excellence at a moderate price, there should be a big future for this utilitarian pastime. But if the British manufacturer is to hold his own in the favour of the British public and in the Colonial and foreign markets the facts I have set forth will have to be faced.

"One great factor to be remembered is this—that it is possible to produce a motor cycle which will be cheap when judged by the standard above mentioned.

"EDWARD S. HODGSON."

A FEATURE COMMENCED IN "THE MOTOR CYCLE" OF MARCH 21st, 1910.

#### ANOTHER NEW PILOT.

WE hear that T. West, the well-known Cheltenham motorist, who has been in the A.S.C. for a very considerable period, has lately taken his pilot's certificate at Hendon.

#### MOTOR CYCLISTS FOR THE R.F.C.

FURTHER to the paragraph which appeared in last week's issue, we have received the following information from Maj. H. Stuart Ebber, Special Recruiting Officer, R.F.C. The R.F.C. is now open to practically all trades, but there are numerous restrictions, the chief of which are (a) that no man who has already received a notice calling him to the Colours is eligible unless allotted to the R.F.C. by his Area Commander; (b) motor cyclists and gunner observers are the only classes of men who may be accepted if fit for general service.

#### A GATHERING OF THE CLANS.

IT is strange how well-known motor cyclists are by mere chance billeted together or get together somehow over in France. Our photograph is of five well-known riders, among them J. Cocker, the Brooklands record holder, formerly with the Singer and Triumph companies; W. Westwood, of Westmorland, a notable competitor in Six Days Trials; Ernest Smith, formerly proprietor of Regal Motors; Artificer-Sergeant Howard Newman, son of Mr. S. A. Newman, maker of the Ivy motor cycle; and R. Bow-nass, the North-country Matchless and N.U.T. rider. Newman is attached to the Royal Engineers; the others are A.S.C. men, formerly attached to the Motor Machine Gun Service. The picture can correctly be described as a gathering of a clan, for five more successful riders it would be almost impossible to gather together, and certainly not in the Forces. Their fine physique and fitness will be apparent from the photograph.

It is a curious fact that the same morning the picture reproduced on this page reached the Editor, our old friend, Capt. G. I.

Francis, A.S.C., M.T., called to see us. Capt. Francis is officer-in-charge of the motor cycle section of the workshops in which some of these men are employed, and was interested to see the photograph of the men, whose services he values so highly. After a very long spell abroad, Capt. Francis is now enjoying a few days' leave.

#### P. AND M.'s AT THE FRONT.

WE learn that Mr. Richard Moore, director of Messrs. Phelon and Moore, Ltd., and formerly a frequent competitor in A.C.U. six days trials, left on Friday last for G.H.Q. in France under War Office instructions to give expert advice and assistance in the organisation of depots for P. and M. motor cycles with the British Expeditionary Force. His visit is expected to occupy about ten days.

#### DESPATCH RIDERS HARD AT IT.

CPL. A. W. CLOSE, R.E. despatch rider, and one of the Editor's recruits, writing from France, mentions how busy he is being kept, and is constantly out and about on his machine—a Douglas. The machine he has is not the first with which he was supplied, and he emphasises what other despatch riders have brought out, viz., the severe testing all despatch riders' machines receive. The weather lately has been very rough at the Front, which has not lessened the D.R.'s difficulty. He mentions, finally, that the Artificer-Sergeant of his battalion is the Ivy expert, Howard Newman, and remarks that he is a general favourite and a friend to all D.R.'s.

#### MOTOR CYCLIST VOLUNTEERS.

IT appears that motor cycle sections are not covered by the scheme of recognition of volunteers which we referred to last week. The infantry and other attached units are fully recognised, and their officers have been granted commissions.

#### FROM INFANTRY TO R.F.C.

CAPT. CHARLES HIGHAM, a motor cyclist and car owner well known in the Manchester district, and a valued contributor to the pages of *The Motor Cycle* in peace time, formerly

Capt. Chas. Higham.

O.C., A.C. 8th Battalion Manchester Regiment, was some months ago transferred to the Royal Flying Corps, and is now an Equipment Officer.

Capt. Higham was one of the founders of the North-Western Automobile Association, which body has nearly two thousand motor cyclists and car drivers on its competition register.

#### A MOTORIST'S WAR BOOK.

MR. FREDERIC COLEMAN'S book "With Cavalry in 1915," just recently published, contains only one reference to despatch riders, but it is such a splendid testimony that it is well worthy of reproduction here.

"Once during the afternoon my work took me to Ypres, but not beyond it. A fresh attack was on, and the Boches were sweeping the Menin Bridge and the road beyond with shrapnel.

"Even Macfarlane's intrepid motor cyclists could no longer go over it with their signal corps messages, but were compelled to dismount, leave their motor bicycles in Ypres, and proceed on foot to Potijze by a roundabout route through the fields. These cyclists generally used a road long after it had been given up as impassable by everyone else, and when they at last abandoned it as too dangerous for use it was indeed time, in their parlance, to 'give it a miss.'"

A GATHERING OF THE CLANS

A group of well-known men in the motor cycle world. (See paragraph on this page.)

## MOTOR CYCLISTS IN THE AIR SERVICE.

Motor cyclists attached to the 41st Reserve Squadron, Royal Flying Corps. Their machines, it will be noticed, are P. and M.'s and Triumphs, though there is a privately-owned two-stroke lightweight among the group.

## HIGH PRAISE FOR ARMY MOTOR CYCLES.

**A** LANCE-CORPORAL artificer writing from Egypt says: "You should see the work our poor little 'Duggies' have to do, ploughing through sand for miles and miles, running day in and day out. They were just as satisfactory in the broiling sun with oil as thin as water. I am certain that there is no motor cycle of foreign origin that can hold a candle to this wonderful example of British workmanship and material.

"The same applies to the Triumphs here. They also do not know the meaning of the word 'trouble.'"

## STIFF QUESTIONS FOR A.S.C., M.T., COMMISSION ASPIRANTS.

**J**UDGING by stories which are going the round among experienced motorists, some of the questions that candidates for commissions in the A.S.C., M.T., and R.F.C. have been asked can be described as "the limit." We cannot say how true the statements are, but, at any rate, we give a few questions which we have heard at different times which candidates have been plied with:

1. What do you know about a gear box?

2. You are in charge of a unit, and receive intimation that your lorries will be inspected in two days' time. What steps would you take?

3. The sparking plug of your Triumph cycle becomes unserviceable; you have no spare. How would you carry on?

4. Mention any four parts of a lorry, indicating their position.

The above were taken from the September issue of *On Service*. Here are a few more:

5. You are descending a hill at 27 m.p.h. on a Crossley car; your brakes refuse to act; likewise the switch is out of commission, the petrol tap is too far away to turn off. What would you do?

6. How many nuts are there on a Ford car?

One really sensible question we heard the other day was as follows:

7. You are driving a lorry, and the gear box is damaged to the extent that a new box must be fitted. How would you prove, after fitting the box on the road, that the shafts were in line?

## AVERAGE PRICES.

**W**E give below the average prices of second-hand models offered for sale in *The Motor Cycle*, where it is possible to obtain a sufficient number of each model.

## NEW ZEALAND RACING.

**T**HE Pioneer Motor and Sports Club opened the season on October 21st at New Brighton beach with a meeting of two races only. The beach was very heavy owing to the tide having recently receded, and the entrants were further handicapped by a strong wind. The attendance was small, the cold weather being a deterrent. Results:

## FIVE MILES MAIDEN HANDICAP (SOLO).

1. O. H. Green (7 Indian), 25 sec.
2. H. S. Curtis (7 Indian), 25 sec.
3. R. L. Kennett (7 Harley-Davidson), scratch.

## TWENTY-FIVE MILES HANDICAP (SOLO).

1. G. Moffett (4 Triumph), 3 min.
2. H. S. Curtis (7 Indian), 2 min. 30 sec.
3. F. Haworth (4½ B.S.A.), 5 mins.

Time 25 min. 3½ sec.

## A FAMILY SIDECAR AND A 1917 AMERICAN MODEL

The above photographs were sent us by Mrs. J. Lang, of Waterbury Conn., U.S.A., and show—(1) her family sidecar outfit, and (2) her husband, J. Lang, astride a 1917 model Harley-Davidson with military drab finish. Mr. Lang will be known to many of our readers, as he raced at the Celtic Park, Glasgow, thirteen years ago, and competed in 1909, 1910, and 1911 in the Tourist Trophy Races on an N.S.U. and two Matchless respectively.

## A SIDECAR AMBULANCE.

**W**E have received details of a Rover sidecar outfit which Mr. D. E. Fountain, Rose Branch, Scartho, Grimsby, has adapted as an ambulance for the use of the St. John Ambulance Brigade (Grimsby Division), and the owner's action may be an incentive to others. The springs of the ambulance have been fitted under the frame, instead of at the top, to give a lower position, and four U-shaped clips are attached to the upper part of the springs, into which the frame of the ambulance drops. The sidecar wheel

is half enclosed in zinc to prevent mud being thrown underneath the carrier, and a box containing the first aid outfit has been fitted to the chassis. Mr. Fountain will be pleased to send further details to

readers who may be desirous of pressing their sidecar outfits into this useful service. With a little ingenuity we think the chassis could be so made to take both the ambulance and the sidecar. To render them interchangeable should not present any difficulties, and a very useful double purpose vehicle would be the result.

A  
CONVERSION  
WITH A  
WORTHY  
OBJECT.

A reader has placed at the disposal of the St. John Ambulance Brigade, Grimsby Division, his Rover motor cycle combination, the sidecar chassis of which is arranged to carry an easily detached stretcher. The idea is good, and we congratulate Mr. Fountain on turning his outfit to such a useful purpose

### TIMES TO LIGHT LAMPS.

#### GREENWICH TIME.

Dec. 14th	...	...	4.19 p.m.
" 16th	...	...	4.20 "
" 18th	...	...	4.20 "
" 20th	...	...	4.21 "

### Trapping by Eligible Policemen.

When summoned at Brentford recently for exceeding the speed limit, Mr. Rowland Williams stated that he considered it a national scandal that three able-bodied men, excellent material for the Army, should be kept at home to undertake work of this character.

### A Hobby which Paid.

A motor cyclist of Norwich, Conn., U.S.A., who has been unflinching in his promptness in attending fires with a motor cycle and sidecar, has now been placed on the permanent fire staff, and in future will be paid for his services. It was his habit for three years to answer practically every fire call, stopping for the Deputy Fire Chief, and taking him to the scene of the conflagration in his sidecar. In three years he has answered more than 200 fire calls.

### A Chief Constable's Purchase.

Among recent well-known purchasers of Harley-Davidson combinations is the Chief Constable of Monmouthshire, Victor Bosanquet.

### A Car Number Wanted.

A correspondent has asked for our assistance in tracing the car which he alleges ran into his sidecar on the Portsmouth Road, near Putney Heath, shortly after four o'clock on the afternoon of December 3rd. The sidecar was driven violently against a pony and trap, and the occupants thrown out. The driver of the car slowed up momentarily, but then dashed off. If any of our readers witnessed the occurrence, perhaps they will send us the number of the car.

### The Rear Car.

We have the sidecar and the cycle car, but the Americans go one better and have a rear car. This is a trailer attachment clamped to a motor bicycle, turning it into a four-wheeled vehicle, solitary examples of which were produced in this country in 1904. The most luxurious models are fitted with a limousine body, which is luxuriously upholstered and equipped. We hardly think that this type of attachment would become popular in England. The driver is quite isolated, and has not the pleasure of having his passenger beside him, and the vehicle, being a four-wheeler, would, if used over here, be liable to a car tax.

### American Two-stroke Exit.

It would be interesting to know why the Hendee Manufacturing Co. dropped the two-stroke single-cylinder lightweight which was included in their 1915 programme, and replaced it by the 2½ h.p. flat twin which was described and illustrated in our issue of October 5th.

### England Pays—America Pockets.

Twelve months before the outbreak of war the Sunbeam Motor Car Co., Ltd., established many world's records on a twelve-cylinder machine. This was the first car in the world of such a type, and would have been marketed but for the war. An American firm has now copied the engine and standardised the twelve-cylinder car from the Sunbeam Co.'s machine so successfully that the company has been able to pay a dividend of 50% on a capital which had to be increased twofold to meet the great demand.

### More Money for Technical Schools.

The Government has made an important declaration with regard to further financial assistance in aid of scientific research work as applied to industry. The State is to discuss with the local authorities concerned and the governors of schools certain new draft regulations which will simplify administration and stiffen up the instruction. "It is desired," says Lord Crewe, "to make the road easy for those sons and daughters of Britain who see the beacons of science shining ahead of them on a high hill which it was their life's work to climb."

### SPECIAL FEATURES.

#### A THREE PURPOSE SIDECAR

(Illustrated).

#### THE DOUBLE-ACTING TWO-STROKE.

### The R.A.F. Hill Climb.

On the occasion of the last R.A.F. hill-climb W. F. Guiver (Ariel) was awarded the special prize for the best performance of the day.

### "Joining Up."

Last week there was a certain revival of applications for particulars from motor cyclists desirous of joining the Services. Of the twenty-one enquiries received the majority required information respecting the Heavy Section, Machine Gun Corps (Tanks), the Motor Machine Gun Service, and the R.F.C.

### A 2,700 Mile Trip.

Two American motor cyclists have planned a 2,700 mile trip, carrying a full field equipment (with the exception of the rifles), weighing 110 lb. The primary idea is to impress the United States Army officials still further with the importance of the motor cycle as an adjunct to the military organisation of the country. A message will be carried from a major of the New York National Guard to Governor Whitman, of New York, under strict military field conditions, and the riders will use a Harley-Davidson combination.

Motor cyclists of the London Section (D Squadron) of the National Motor Volunteers, snapped during their week-end manoeuvres. The sidecar outfits are an Enfield and B.S.A.

**Our Christmas Number.**

The next issue of *The Motor Cycle* being our Christmas Number, we shall follow our usual custom and publish one or two articles in a lighter style and applicable to the season—we wish we could say the festive season.

**Palmer Tyre, Ltd., Report.**

The accounts of the Palmer Tyre, Ltd., for the twelve months ending September 30th, 1916, show a profit of £10,687.

**Lights on Pedal Cycles.**

Motor cyclists have had to conform to all the Lighting Orders for some time past, and it is rare now to see an acetylene or electric head lamp on a motor bicycle which does not conform to the regulations with respect to dimming. Pedal cyclists in many districts are not so blameless, and it is not at all uncommon—in fact, it is common—to see undimmed acetylene head lights of comparative brilliancy on "push bicycles."

**A Wrong Interpretation.**

We tackled a push cyclist about this the other day, and he expressed the opinion that the Order does not apply to his machine, and on going further into it we found that in many instances the authorities imagine that they can only proceed against cyclists if the light be too brilliant.

**The Correct Exposition.**

Now that is a wrong interpretation of the Order, and our legal adviser says that "The word 'vehicle' is the expression generally used in the Order, and the interpretation clause shows that it includes any bicycle, tricycle, or velocipede, so that the whole of the Order really affects push cycles." Pedal cycles fitted with acetylene or electric lights which are undimmed should therefore be proceeded against, otherwise motorists cannot be expected rigorously to comply with the law.

**Mr. Wells back in England.**

We are glad to learn that Mr. W. H. Wells, the London manager of the Hendee Manufacturing Co., has arrived safely from the United States, where he has been for some months. He was to have been accompanied by Mr. Russell Coes, a well-known American exponent of the Indian motor bicycle, whose brilliant riding in several trials during 1913 will no doubt be recalled. At the last moment this rider was prevented from sailing with Mr. Wells on the ss. *Philadelphia*.

**Treacherous Roads.**

In certain districts during the week-end the roads were in the most treacherous condition. In Berkshire, for example, it snowed, then rained, and then froze during the night, with the result that the roads were a sheet of glass the next morning. On one particular hill two cars turned completely round within the space of five minutes, and a motor cyclist who came to see if he could be of any assistance had his machine slip from under him while attempting to restart. Immediately afterwards a pedal cyclist came a cropper after he had been warned to dismount. The main Bath Road was treated with gravel, but for some unknown reason the road to Henley was totally neglected.

**Death of A.C.U. Helmet Inventor.**

The death took place on Friday of last week of Mr. Frederic S. Hess, the inventor of the helmet made obligatory by the A.C.U. for the last Tourist Trophy Race in the Isle of Man. This helmet was undoubtedly the means of saving the lives of a number of competitors, and has proved to be as useful in racing as the shrapnel helmet in warfare.

**Imports and Exports.**

The number of motor cycles imported during November was thirty-seven, and the value £1,474. When the value of parts is added, the total amounts to £5,520. These are evidently commercial vehicles, as ordinary imports have been prohibited since March. In October last no motor cycles were imported, but the value of imported parts was £3,669.

The export figures are naturally far in excess of the imports, the November exports being as follows:

1914.	1915.	1916.
1,375	1,690	1,612

motor cycles, and the value of these machines, including parts, was:

1914.	1915.	1916.
£95,233	£124,543	£106,883

The total for the past month is £1,473 more than for October. The total for the year is £879,616 at present, but it is not likely to exceed one million pounds, as it did in 1914.

**Huge Petrol Imports.**

No less than 18,004,011 gallons of motor spirit were imported during the past month, and the total for the year exceeds 157 million gallons. In October the total was 16,399,255 gallons, and in November, 1915, 10,254,496 gallons.

**The National War Funds.**

At the week-end the principal war funds stood as follow:

The Prince of Wales's Fund (distributed £3,509,475) .. ..	£6,012,734	0	0
British Red Cross Fund .. ..	5,380,627	0	0
Tobacco Fund .. ..	121,233	0	0

**A Description of the Zeppelin Engines.**

The December number of *The Automobile Engineer* contains a full detailed description of the 200 h.p. six-cylinder engines fitted to the Schutte Lanz and Zeppelin airships. Our contemporary is enabled to do this by permission of the British naval and military authorities. *The Autocar* of December 16th also contains a full description of the same engine, and our readers may be more interested in this, as it is written for the benefit of the average reader of a motor paper. Each engine has six cylinders 150×190 mm. bore and stroke, and many most interesting and novel features that are described in simple language and illustrated by detail sketches.

**Still Another Missing Motor Cycle.**

With reference to our paragraph on page 458 (November 23rd), a correspondent tells us that he has had a very similar experience. A man in uniform wearing badges of the 17th Lancers, but with shoulder letters of the 7th Lancers (which regiment does not exist), appeared in answer to an advertisement. He explained that he came from the Major commanding the depot, and asked if he could fetch the machine from Salisbury, where it was being overhauled. Permission was given, and neither man nor machine has been seen since. The machine is a 1913 3½ h.p. Triumph, with free engine and standard bars bent out and down.

**THE FAMILY SIDECAR.**

The sidecar is becoming more and more popular as a general service vehicle. Our illustration shows Mr. H. Gorrings and family on their Bradbury outfit, which has served them well for a year.

## The Future of the Single-cylinder Mount

By CAPT. A. LINDSAY, R.A.M.C.

**M**AY I be allowed to enter an appeal, on behalf of the 500 c.c. single, against the verdict pronounced by "Road Rider" in the issue of September 28th last and the subsequent support?

His judgment, carefully analysed, centres on the following conditional clause: "Should it therefore prove that an increasing percentage of the riders who lead opinion and demand have done for ever with the 500 c.c. single-cylinder." "Road Rider" takes the proof for granted. It is against this veiled assumption that I am appealing. There has been no remarkable demand for the summary execution of our most dominant type of motor cycle. Thanks to *The Motor Cycle* spring frame campaign, there has been a demand for marked improvement in its comfort. There is undoubtedly a prejudice against the single in some quarters—a *perfectly justifiable prejudice* when one ceases to generalise and begins to mention names. The culprits are well-known, and unless radical alterations are made to certain single-cylinder mounts they alone are going to be the victims of "Road Rider's" judgment.

### Absence of Vibration.

He complains of the "thumpiness" of the big single. I am afraid he has been unfortunate in his choice of big singles. Perhaps he has had "some" of these hastily designed "catch-penny" big singles which had a mushroom-like growth a year or two ago, in which case he is deserving of sympathy, not abuse. The elimination of road vibration is going to be the crux of the question. "Road Rider" opines that the raising of the standard of comfort by spring frames will make us intolerant of anything but an even impulse, vibrationless engine, and as a result the single will gradually die out. I deny that absolutely, and, assuming the prophet's mantle, dogmatise thusly: "The adoption of spring frames particularly, and the improvement of springing generally, is going to mean a new lease of life for the 500 c.c. single."

"Road Rider" also complains of engine vibration. Engine vibration in the higher class singles is practically unnoticeable whether the engine is pulling slowly or "revving." This is against all theory, but the fact remains that the running of three or four singles I have in mind thoroughly deserves the adjectives "effortless" and "vibrationless." Watch a  $3\frac{1}{2}$  h.p. Blackburne turning over in neutral! Sit on a  $3\frac{1}{2}$  h.p. or 4 h.p. Norton chain drive at 8-10 m.p.h. on top gear in traffic, or a  $3\frac{1}{2}$  h.p. Sunbeam or Rover at 30 m.p.h. in the open! Picture one of these engines in a fore and aft insulated frame, and you have my  $3\frac{1}{2}$  h.p. single of the future.

### V Twin Engines.

A comparison of present day manufacturing practice will strengthen the case for the single materially.

The single engine lends itself best of all to simple, strong frame construction, and allows of most consideration being given to such vital factors as weight distribution, engine accessibility, cooling problems, lubrication, and protection of working parts from the ravages of weather, dust, and mud.

Most of these remarks are equally applicable to the V twin of moderate power. Here our designers are up against some constructional problems peculiar to this type of engine alone. Cylinder angles, cooling, lubrication, big end bearing, design, engine balance, and firing periods.

Ignition timing in this type of engine is still merely a compromise even after a considerable number of years of experimental work. Considering everything, V twin design is in a very unsettled state by comparison with its one-lunged brother, and I am afraid the manufacturer who proposes to supplant the single with a V twin combining all the constructional excellences of the despised and rejected has a long row to hoe yet. We had a mild sort of boom in 500 c.c. V twins recently—1914, I think—but the heather was not set on fire. The number of factories relying entirely on a 500 c.c. twin machine for their livelihood is still very small.

### Flat Twins.

The horizontal twin engine also has its worries. On its credit side we have its wonderful balance and consequent revving capabilities, all factors making it an undoubted treat to ride. On the debit side there are several serious problems to be faced.

It is an awkward engine to build into a motor cycle frame without making the wheelbase too long for solo riding. Special frames have to be built to avoid this lengthening of the wheelbase, and as a result we have had some weird efforts. Usually it meant some vital portion of the cylinder and valve gear being carried low down outside the frame, where it was exposed to dirt and the liability of severe damage.

Engine inaccessibility has been quite a marked feature. Cooling of the rear cylinder has never been satisfactory. Inherent with the cooling problem is the problem of lubricating both cylinders equally.

The necessarily long induction pipe is not an aid to good carburation,\* and possibly helps to account for the slightly disappointing petrol consumption of this type of engine.

The four-cylinder engine has only a very small footing at present, and I do not look on it as a serious competitor just now. When we start building our engines almost entirely from some aluminium alloy, possibly then the *en bloc* four-cylinder engine may come into its own. Presumably, then, "Road Rider" will write a "Plea for the six-cylinder."

\*Mr. Granville E. Bradshaw, the designer of the A.B.C., in the issue for Dec. 7th, refutes the assertion that a long induction pipe is a drawback.—Ed.

Wintry conditions do not damp the enthusiasm of the National Motor Volunteers. The photograph shows members of the D (London) Squadron during the operations arranged for last week end.

A comparison of the performance of the four types of engines—single, V twin, flat twin, four-cylinder—substantiates Mr. Norton's claim that the single is "mechanically and thermally the most efficient engine we have."

In speed, power, economy, reliability, and value for money the single has it every time, if the buyer is careful and does not rush in and take whatever the loquacious agent offers him.

#### The Trend of Public Opinion.

"Road Rider" and I differ in our interpretation of the trend of public opinion just now. The last three years have seen a boom in lightweight two and four-stroke machines. Particularly has this been marked since the war began. The principal result has been the "graduation" of large numbers of motor cyclists, who but for the crisis might still be entirely ignorant of the joys of the sport. This rapid graduation implies simplicity and solidity of design for some years to come, and here is where the 500 c.c. single manufacturer is going to reap his reward. He is in a position to supply the demand that will arise after the war, whilst his "comfort seeking" brother

manufacturers are learning their job. For some time to come their experimental departments will be working out their own special problems.

To summarise, my opinion is that the  $3\frac{1}{2}$  h.p. single will, by the adoption of efficient front and rear springing and careful attention to engine balance and transmission, easily keep its dominant position in our trade, a position it has won by sheer superlative merit. The  $3\frac{1}{2}$  h.p. single engine balance problem is going to upset some people, I am afraid, because intimately bound up with the success of the single of the future is the success of the long stroke engine with its light reciprocating parts and excellent balance, coming as near to theoretical correctness as is possible in a single-cylinder engine.

To conclude, I am willing to risk this further prophecy: The  $3\frac{1}{2}$  h.p. single of the future will be a  $3\frac{1}{2}$  h.p. long stroke engine, unit construction, engine, magneto, dynamo, housing, and gear box cast *en bloc*. Semi-open frame. It will have front and rear springing, as well as forced lubrication and automatic carburation. Electric lighting would be a standard feature.

#### MANUFACTURERS CONSIDERING THE FUTURE.

Last week a meeting of motor cycle manufacturers was held at the Grand Hotel, Birmingham, at which Mr. Humphries, of Humphries and Dawes, Ltd., makers of the O.K. motor cycle, proposed, and Mr. Downs, of New Imperial Cycles, Ltd., seconded, and it was carried *nem. con.*:

"That this meeting favours co-operative action by British motor cycle manufacturers, through some organisation from which foreign manufacturers' influence must be completely absent, with a view to complete co-operation with other British industries and the preservation of the British motor cycle industry in future."

## OXY-ACETYLENE WELDING.

Broken Castings and Damaged Keyways built up and made as good as New by a Welding Process.

**W**E spent a most interesting morning recently watching repairs to motor cycle cylinders, crank cases, and crankshafts by means of the oxy-acetylene welding process, carried out by Messrs. Barimar, Ltd., 10, Poland Street, W. The company's workshops are at 13, Lamb's Conduit Street, W.C. Outside the building is a large acetylene generator, while inside are oxygen cylinders. The two gases are mixed and issue in correct proportions through a special torch. The first job we saw was one very similar to the accompanying photograph, in which the flange had been broken off the base of the cylinder. Only one original corner of the flange was left, and the remaining three pieces were welded on, and also the spigot.

### Protecting the Eyes from Glare.

Watching the repair through darkened spectacles, one saw the workman with a stick of cast iron in one hand and a torch in the other sealing up the joints of this cylinder casting, filling up the holes, and finally building up the spigot which projects into the crank case. As soon as the repair is completed, the cylinder is taken into the adjoining workshop, and all roughnesses are carefully ground down, most ingenious appliances being used for this operation. The emery wheel is on a flexible shaft, so that it may be moved about in any position.

In the case of the repair we were watching, the holes for the holding-down bolts were all filled up, and after the repair had been completed new holes, of course, would be drilled. One of the greatest advantages of the Barimar workshops is that the finishing off is done on their own premises, and any defects which may occur in the welding can be discovered before the cylinder is sent away. It is extraordinary what excellent work is done by this firm.

Owing to careless fitting sometimes a flywheel keyway in the solid crankshaft of a horizontal twin or a two-stroke is damaged. In a case of this kind the gap is filled up with steel and then ground so that the repair is hardly visible. Afterwards a fresh keyway is cut and the repaired crankshaft is as good as new.

We saw many examples of broken aluminium crank cases due to a broken connecting rod smashing its way through the ends or side. When this happens the broken part is neatly welded in position, and, as will be seen in the accompanying photograph, the patch is practically invisible after it has been finally dealt with. We saw other parts undergoing repair, e.g., a broken boss which held the bush for one of the timing gear bearings. A valve had been sent in two pieces so that the stem might be welded up and made as good as new, and numerous crank cases had also been received in which the main bearing bosses had been cracked and allowed the bearings to come adrift. Nearly all makes of motor cycles were represented in the firm's workshops.

One of the most interesting repairs shown to us in

operation was the welding of a new tooth on to a broken gear wheel, and this is a repair which might often be required by motor cyclists, for over-hardened gear wheels or timing wheels are liable to give trouble in this respect.

At the present time, when spares are difficult to obtain, this work is of extreme importance, and many motor cyclists who would otherwise scrap broken parts of their machines will be glad to know where they can be effectually and skilfully repaired. A separate department has been allotted to the repair of radiators and lamps. We noticed a Scott radiator being treated, while lamps, however battered their condition, may be restored to look almost like new.

A crank case minus a lug, and the repair on the right.

A damaged keyway, which can be made like new by the oxy-acetylene process.

SOME TYPICAL BARIMAR REPAIRS BY THE OXY-ACETYLENE WELDING PROCESS.

The lower views show that even the base of a broken cylinder can be rebuilt.

## ALUMINIUM ALLOY AND STEEL COMBINED.

**A**LUMINIUM alloy is every day becoming more and more popular for use in the construction of internal combustion engines—in the first place, undoubtedly on account of its extreme lightness, while its propensity for rapid heat conduction is also a point greatly in its favour, especially for air-cooled engines. Practically the only point not in its favour is the fact that its somewhat soft nature does not lend itself to any great strain, such as, in the case of a piston, the carrying of the gudgeon pin. This difficulty has been overcome in the piston herewith illustrated by fitting a steel liner over the lower portion of the piston, so forming the skirt and providing a strong bearing to carry the gudgeon pin, thus enabling strength, lightness, and good heat conducting powers to be combined.

We understand this type of piston has proved satisfactory, though, without actual experience, one might be doubtful of the result of the combination of the two metals, owing to the different expansions under heat of the steel and aluminium alloy.

## ALUMINIUM PISTONS.

**A**FIRM which long since devoted itself to the manufacture of aluminium alloy pistons is known as the Aero-lite Piston Co., Hanover Court Garage, Hanover Court, Hanover Square, W. At the present time the pistons are used in aeroplane engines, in which they work under extremely difficult conditions, and the manufacturers assume that since they are behaving so well in aeroplane motors they are likely to be equally successful in motor cycle engines.

The pistons are made in sizes from 60 mm. bore to 150 mm., in various patterns, but most of these have the

Aerolite pistons for motor cycle use.

interior of the top rather heavily webbed, not so much for the sake of strengthening the metal, as to provide additional metal to radiate the heat from the hottest part of the piston. The Aerolite pistons are very carefully fitted into the cylinder, and are lapped in with rouge.

## WASHING SIDECARS.

**V**ERY frequently the appearance of the coachwork of a new sidecar is spoilt on the first washing. If once the polished surface is roughened, no amount of furniture polish will revive it. Never give dirt a chance to dry hard on, and never rub the dirt off; sop it off with a hose or wringing wet sponge. Finally, dry the superfluous moisture off with a wash-leather, and polish with special car polish.

## BURNT VALVES.

**O**CASIONALLY a valve becomes so badly burnt and pitted that ordinary fine emery powder fails to grind the face smooth again. A quick method of grinding in, if a lathe or special valve-truing tool is not available on which to touch up the valve face, is to cut a piece of fine emery cloth and fit it over the valve stem, the cutting side towards the valve, and twirling the screw-driver vigorously for a minute or two. Except in extreme cases, however, this method should not be used, as it gets through the carbon glaze rapidly, and if continued too long will score the metal too deeply. Thus the remedy may be worse than the disease.

## BRITISH-MADE MAGNETOS

**A**VISIT we paid recently to the E.I.C. Co. went a long way to confirm our opinion that after the war there will be no need to go abroad for magnetos. The workmanship of the E.I.C. is in every way equal to the pre-war enemy-made article, and as a proof that the firm have the utmost confidence in their work, it will interest readers to know that they issue a very complete guarantee; in fact, although this covers the use of the magneto for twelve months only, its makers are always prepared and willing to replace any defective part, or do anything that is necessary to a faulty magneto for a considerable time after that period has expired.

They impress upon users of their magneto that in all cases the machines should be sent direct to them at Sampson Road North, Birmingham, without being taken to pieces or interfered with in any way. The type A is the most popular model—in fact, the only one now being made; and with an extended armature shaft and raised centres by means of an adapter plate the same model is used for  $3\frac{1}{2}$  h.p. 500 c.c. single-cylinder machines, where the Bosch DA2 was previously employed. Many people are under the impression that a big engine necessitates a big magneto, but the type A has been successfully used on a number of 500 c.c. machines, such as the B.S.A. and others.

We were told that plans have been passed for a new factory to permit of the manufacture of 2,000 magnetos a week. The company is at present almost wholly employed on Government orders. We spent an instructive hour in the works, and left convinced that the utmost care is taken to ensure accuracy of manufacture.

## ORTO WINDSCREEN.

**S**INCE we last described the patent Orto windscreen, made by Messrs. A. Atkinson and Co., 24, Arminger Road, Shepherd's Bush, W., it has been improved by the fitting of adjustable side wings, which greatly add to

Orto windscreen with adjustable side wings.

the comfort of the passenger. It may be mentioned that the most interesting feature of this screen is the fact that it swings back as the door opens, allowing easy access to the seat. The adjustable side screens provide adequate protection against side eddies of air. It is certainly one of the most practical forms of sidecar windscreen we have seen. The sidecar, it will be noticed, is fitted with a hood protected by means of a hood cover, which is a very useful adjunct, as it keeps the hood clean when it is not in use.

## INTERNAL LEAF SPRINGS.

**T**O design a spring frame which shall be entirely different from all its predecessors would seem, seeing that so many designs have been put for-

A spring frame with enclosed leaf springs

ward, a practical impossibility, but while the design by Mr. W. V. Pagett, Dudley, which we illustrate, resembles others in general appearance, it has several new features in design. A triangular rear frame is pivoted behind the bottom bracket and supported beneath the saddle by coil springs such as we have described more than once in recent issues. The lower stays, however, are rectangular in section, and contain leaf springs, which are anchored to a bracket at one end. The specification also provides for these springs to be placed outside the frame and bear upon it, in which case some means of checking lateral movement would be provided.

The enclosing of the leaf springs should enhance the appearance and render lubrication an easy matter.

The Editor does not hold himself responsible for the opinions of his correspondents.

All letters should be addressed to the Editor, "The Motor Cycle," Herford Street, Coventry, and must be accompanied by the writer's name and address.

#### The Hammond "Motor Scooter."

Sir,—I have seen in your issue of November 23rd a humorous description of what you are pleased to call my "motor scooter." The invention, up to the present, exists only on paper, but, as a matter of fact, it is intended to be a tiny car on two wheels, or, in other words, a two-wheeled cycle car. The engine and footboards are actually to be enclosed in a small car-like body, composed of three-ply birch or ash, which, together with ample mudguards of the same material, in addition to the forward vertical shields (as shown in your sketch), gives greater protection from the weather than any motor cycle yet produced. Also the machine is to be fitted with a mahogany dash carrying speedometer, clock, switches for engine and lights, etc., and surmounted by a glass windscreen.

The actual machine, as designed for practical purposes, affords not only ample room for a man of large proportions, but, in addition, the actual comfort of a small car, by reason of being provided with a comfortably upholstered bucket seat and easy wheel steering.

I intend placing this machine upon the market at a future date.

E. V. HAMMOND, M.E.

#### Motor Cyclist Guides.

Sir,—The letters published in your last issue are interesting. Surely able and willing motor cyclists of any age could be utilised and organised to be of national help at the present time. I have been trying to find some such opening, and I know others who have done the same, but so far with no success. One reads occasionally of V.T.C. who want motor cyclists, for some non-apparent use, but, generally speaking, the H.Q. are at a considerable distance and the field of operations probably in quite a strange locality. To take my own case, I live ten miles out in Essex, and I fail to see the use of joining up with a City corps, with assembly not nearer than the City and operations only too likely in South London. If my services and the free use of my machine cannot be usefully employed in the locality in which I live, then it seems to me that we are not required. Or is it that we have not been thought about yet?

A.H.G.

London, E.C.

#### Motor Machine Guns for Cadets.

Sir,—My attention has been called to a statement in *The Motor Cycle* to the effect that the War Office has approved of the formation of motor machine gun sections as part of the cadet training for the Warwickshire Cadet Infantry Brigade.

In explanation, let me say that a machine gun detachment has been in existence in my brigade for more than a year prior to my taking over the command on November 1st last, and is highly efficient both with the Lewis and Vickers Maxim machine guns.

The proposal was made by some of the officers to expand the detachment into a brigade motor machine gun company, and it is hoped by the loyal co-operation and generosity of motor manufacturers and others to be able to do so, in order that cadets may be taught this most important branch of the Service. But it has not yet been submitted to me for my approval, or to the Territorial Force Association for Warwickshire.

The only concession that has been made by the War Office is to permit of the purchase of a number of dummy machine guns for instructional purposes from the D.G.R.A. The impression that the War Office has in any way formally ap-

proved of any general scheme of machine gun training for cadets is not correct, although it is hoped that every encouragement will be given if it be proved to be successful.

It must be pointed out, however, that no part of the capital outlay necessary is chargeable to the public funds, and that the success of the scheme must depend on private efforts.

The guns that will be mounted will be dummy ones for drill purposes only.

WALTER R. LUDLOW, Colonel,  
County Commandant of Cadets for Warwickshire.

#### Export of Motor Cycles.

Sir,—I have just read in *The Motor Cycle* of November 30th a complaint of the Wulfruna Engineering Co. re the prohibition of exports and manufacture now prevailing in England, where it is mentioned that the British Overseas trade in that line will certainly not benefit by such a procedure.

I am entirely of this opinion, and, living abroad as I do, I am able to see both sides of the question, and form even a better opinion of the case as it stands at present. American manufacturers are grasping this golden opportunity and doing their best to capture the European motor cycle market, whilst the English manufacturers are kept out of the way by their own Government.

To mention only one fact, I can inform you that the Hendee Manufacturing Co. have just sent over to Europe the head of their export department, with instructions to study the conditions and requirements of the different allied and neutral countries, and fix up contracts for the coming season, and I can also add that the said representative has started off very well by fixing up a contract of 600 machines with their new Italian agent for the coming year. No doubt there are many more similar cases, and bit by bit the Americans will capture the whole trade, and British manufacturers, when they are again in a position to deliver, will have to start right from the beginning, because in the meantime the Yanks, after having studied European requirements, will endeavour to conform to the requirements of the countries on this side of the Atlantic, and supply machines adapted to the different conditions, and entirely satisfactory.

I therefore think that you should certainly take some very energetic steps to see that the British motor cycle trade does not completely lose its Overseas market after having obtained, by means of much perseverance, superior workmanship, and design, the premier position the whole world over.

Milan, Italy.

G. F. HEAD.

[We again refer to this subject editorially this week.—Ed.]

#### Bearing Pressures.

Sir,—I intended my letter, published on November 23rd, to have been my last on this subject, but "A.A.S." asks me a question to which, although he has not answered mine, I should like to reply. I am not in any way interested in the manufacture of any engine, but if I had been concerned in the manufacture of long-stroke engines I should certainly not have written my letters without revealing the fact. I wrote simply in the interests of fair play, which, I think, the long-stroke engine has not had at "A.A.S.'s" hands. I have already pointed out several instances: here is one more. If the long-stroke is to be denied the advantage of its superior torque, and not be allowed to "rev" at a slower rate, because the extra torque is only the result of its larger capacity, why should it be saddled with the greater weight of moving parts which

appertain to this larger capacity? "A.A.S." is still trying to have it both ways.

Capt. Lindsay's interesting letter disposes entirely of the lubrication question.

With regard to section 2, this was a question of bearing friction with reference to movement between the surfaces, and had nothing to do with the pressure. "A.A.S." has here taken the trouble to prove what was never denied. With reference to the movement in question, if "A.A.S." measures this by the path of the crank pin, all I have to say is that this movement has no more to do with the case than the colour of the tank, and it is only another proof of my assertion that the long-stroke has not been fairly treated.

Lastly (under section 5), we find two statements: (a) "It is so self-evident that the larger  $r$  is the smaller  $F$  will be"; and (b) "it becomes evident that the smaller  $r$  is the smaller  $F$  will be." The meaning is attainable when another constant has been dragged in, but the statements are unfortunate and confusing; in fact, the whole paragraph is very obscure, and, I think, bears out my statement.

In conclusion, may I thank "A.A.S." for explaining several points which were already perfectly clear, and you, sir, for the space you have allowed me?

JOHN BONYTHON.

### The Flat Twin at the Bar.

Sir,—I have read Mr. Granville E. Bradshaw's article in the last issue of *The Motor Cycle* entitled "The Flat Twin at the Bar," as well as many other of his writings on his engine, and I feel I would like to say something on the matter.

Mr. Bradshaw seems to find it a very easy matter to talk and criticise other people's designs; he also finds it quite easy to fill in parts of other designs with a little shading and call it a "hot" side—he also shows his drawing but fails to fill in any shading. I might mention it would be quite easy for me to fill in some shading on his combustion chamber and call it a "hot" top, and I would be quite justified in doing so, for it is no doubt a very "hot" top. I would myself prefer a "hot" side to a "hot" top, as with the former the piston and the oil which it brings up can conduct the heat away, whilst the "hot" top causes self ignition and destroys as many plugs as can be put in, which is well known to Mr. Bradshaw I have no doubt.

Well designed engines like the M.A.G., "hot side" or no "hot side," do not blacken their rings or scorch the oil or cause the plug electrodes to drop into the cylinder, and I can only conclude that Mr. Bradshaw has had experience with a poor assortment of engines, if that is what he has found. The M.A.G. engine, if it is as hot as it can get, has as good, if not better (not worse), compression as when cold, which is very easily tried. The cylinders when they expand are circular, and the rings of course go with them. I have known cylinders that expand in all directions, and, judging from his remarks, Mr. Bradshaw has had a similar experience.

Probably by the time Mr. Bradshaw has made and sold his 5,000th motor cycle engine he will change his views about the duties of a designer. There is no secret in making an engine that will run at 70 m.p.h. when new. After the first few "blinds," its owner looks in vain for the electrodes of the plugs (as the writer witnessed on certain machines in the 1914 T.T.), and finds with very great regret that his bearings have been thumped loose and that the 70 m.p.h. is no longer obtainable.

As regards "pitiable sketches," which Mr. Bradshaw so freely writes about, I should like to know what he thinks now of the so-called wonderful drawings and the marvellous flat twin that came from them, and which was to astonish the world by its Brooklands performances in the "happy days," and what its clever designer thought when it merely lapped at 48 m.p.h. instead of, according to drawings, about 80 m.p.h.

I call a clever designer a man who designs engines like the M.A.G., that can be used by any firm, in a sensible frame, fitted with any type of speed gear, and any plug. The M.A.G. Co., who have made about 50,000 engines, do not appeal only to the speed man, who generally wants his machine and repairs free of charge, or as near to this figure as possible. Several people have burnt their fingers in

supplying racing engines as commercial engines, and Mr. Bradshaw may find himself in the same boat, in my opinion.

I cannot see at all why such a wonderful and powerful engine as the A.B.C. is supposed to be, that will pull from 4 to 70 m.p.h. on the top, requires a four-speed gear box, which increases the cost of an already expensive machine, and in which after a few months' use, when wear takes place in the actuating rods, etc., only three, or, in some cases, two speeds are obtainable. Perhaps the four-speed box is to allow a very low gear to enable this flat twin to pull at low speeds. This is sometimes necessary on certain engines.

After there are a number of these racing engines, which we have heard so much about, fitted to touring machines and with sidecars, in the hands of the public, I am confident it will be Mr. Bradshaw's best guide, and I am equally confident that he will be ready to eat his own words.

The M.A.G. Engine Co. have made a few racing engines for speed men, but have not found it necessary to shout in newspapers about providing "rude shocks" and such nonsense. They depend upon performances (which are not imaginary ones) for their excellent reputation, at home and on the Continent. Their engine has been designed by "some designer," who is a practical man as well as being theoretical.

If engines are made to a good design by the very best materials obtainable on the very best tools obtainable, by mechanics, they will give good results in the hands of the general public. If the iron is of the right composition, our works have found that it gives far better results than steel for cylinders, and it is also necessary that the piston rings be made of the right material. I have seen rings which I should be very sorry to see in a M.A.G. engine, but perhaps Mr. Bradshaw when he used iron was unfortunate enough to have used that which would be more suitable for mangles and bedsteads and such type of ironmongery.

I do not want to be considered as unduly criticising Mr. Bradshaw's machine or his good self. I have no doubt that his engine is quite good, and perhaps he knows much more about the subject than I do; but I do know one thing—he is looking for trouble which he will undoubtedly find.

Many makers have tried to combine high compression, quick lift, steel cylinders, light pistons, and other light parts, etc., and sell them as commercial engines, but those people who once did it do not do it now, for very obvious reasons.

OSBORNE DE LISSA,

THE M.A.G. ENGINE CO., LTD.

### Will the Multi-cylinder Survive?

Sir,—My first two motor cycles were multi-cylinder machines—twin two-strokes—which are, of course, practically equivalent to four-cylinder four-stroke machines as far as even torque is concerned. My present mount is a long-stroke "big single" (Norton), and for pleasure of riding there is simply no comparison, the single being far ahead. There is absolutely no unpleasant vibration or "racketing," and the steady pull of the long-stroke engine is infinitely pleasanter than the hum and racket of a twin or four-cylinder. Every horse-rider knows the sensation of the long steady strides of a powerful horse "at speed" or up hill—a car or train running on lines may get there just as quickly, or more so, but for sheer exhilaration the horse is a long way ahead.

It is this feeling of "life" in the engine which is the making of the single—especially the long-stroke "big single." It is shared by no other type of machine, and if machines were only obtainable fitted with electric motors or petrol turbines giving an infinitely even torque, I, for one, would give up riding as a pleasure, and would merely use the machine as a means of travel when train or tram was not available. Every rider who has tried the two types knows that there is no sensation of power when riding a twin as compared with a single. The twin may get there just as soon, but the little patter-patter strokes and feeble explosions in the small cylinders do not give the feeling of "life" which a single possesses.

The flat twin, for which there is such a craze just now, is, in my mind, out of the running as a practical mount wherever economy is of account. Every engineer knows that, even in a slow-moving steam engine, a horizontal piston soon wears the cylinder to an oval, as all the weight of the piston rests on the lower part of the cylinder only. In a high-speed petrol motor it is much worse, and that is the reason why a

horizontally-opposed twin has "a short life and a merry one." If it were possible to carry it in the frame, a vertically-opposed twin would be a much more practical proposition. To a certain class of riders who can afford to buy a new machine every few months, this question of wear and tear may not appeal, but where economy is considered the flat twin is out of it. But there is no doubt that until comparatively lately the single has not had a fair show.

Then as to gear. Manufacturers, either through ignorance of mechanical laws, or in order to please customers with a craze for utmost possible speed down hill or on a dead-level road, in almost every case insist in sending out singles geared much too highly for sidecar work, with the inevitable result, a jerky and uncertain drive, especially at low or moderate speeds.

Numerous experiments with singles have proved to me that the best all-round gear for sidecar work, to give best average speed and efficiency, should not be a fraction higher than 6 to 1 for top gear of a  $3\frac{1}{2}$  h.p. single. A larger engine like the 5 h.p. "big single" will, of course, stand a higher gear, but best results are obtained with a  $5\frac{1}{2}$  or  $5\frac{3}{4}$  to 1 gear. Such a gear will give far smoother running—no "tugging"—and better average speed, and also better petrol consumption, than a higher one, as the middle or low gears are much less often engaged.

As to reliability on the road, argument is unnecessary to prove the great superiority of the single. The twin (not to mention the four-cylinder), having far more moving parts, must be more liable to breakdown—equality of material and workmanship being the same in both machines. The single, therefore, I consider, has by no means "had its day"—it is rather just coming into its own—and I believe that, after the war, when economy will have to be practised by many riders who now buy a new machine every season, there will be more demand than ever for the chain-driven single.

NICHELMORE HITCHCOCK.

#### Sidecar Suspension.

Sir,—I am sending you herewith two drawings of a sidecar which I hope will prove of interest to you, inasmuch as the suspension is by shock absorber rubber cord, obtainable from all dealers in aeroplane fittings, etc. As will be seen in the drawings, two suspensions each side take the weight and other downward stresses, while the rebound is taken by one suspension each side. All the rubber should be fitted under slight tension to keep everything taut. The drawings are not to scale.

Sidecar suspension referred to in A. H. Jenkins's letter.

ALEC. H. JENKINS.

#### The All-weather Motor Cycle.

Sir,—We ask for space to reply to some of Dr. René Camus's assertions in his article on mudguarding in your issue of November 23rd. We will take them in order:

He says: "Where air passes during running, mud and dust also pass." This is true as to dust, but our patent front wheel mud-shield permits the air to pass but no mud or splashes, as proved by many thousands of miles running in the worst of weather. This is brought about by placing a flange close up to its work, so constructed as to intercept the blown back spray and conduct it to the ground. This flange creates a vacuum behind it, the air rushes in, impinges on the cheeks of the mud-shield, and is swept direct on to the engine. This is proved by the cheeks being always free of dust, swept clean by the current of air.

Now as to the protection of the rider. Dr. René Camus says: "We must know the manner in which the mud is thrown." This, of course, is the base of all experimenting. And he gives data to work to, viz., "There is the mud which is splashed up under the front and back tyres to right

and left." We agree, and say this is the source of nine-tenths of the trouble, and we are surprised that Dr. René Camus, as a medical man, and knowing how mud and filth carry disease germs, did not suggest a design to prevent the mud rising from this danger spot and conduct it back to the road at once. Dr. René Camus's design, shown in fig. 4, is useless for this purpose. The mud splashed up by the tyre rises, according to the pace, outwards and upwards to about 2ft., and is then blown in by the wind in the form of spray all over the engine and rider. The second trouble is that the centrifugal force of the wheel carries the liquid mud along the centre of the mudguard to the fore-end, where it drops, and the wind blows it back over the upper part of the machine and rider. This centrifugal force, however, is beneficial to the mudguarding of the back wheel if the mudguard—front and back—is constructed to drop perpendicularly to the ground from the horizontal diameter. The mud thrown off the tyre at the back at a tangent is trapped, carried forward between the valances, and deposited on the road at the fore-end. Valances, we find, contrary to Dr. René Camus's statement, act an essential part. Without them the air pressure from the centrifugal force forces the mud outwards to drop from the edge into the belt rim; but with them the air pressure is increased within the mudguard, and the mud is thereby carried forward within a channel to the ground. Perhaps Dr. René Camus referred simply to valances put on at places to intercept splash. In that case, we agree with him, they are useless. The perfect back mudguard must be at least 7in. wide at the back and top to overhang the belt, then taper gently to pass between the stays, and continue below the belt to keep it clear of mud.

It is almost impossible to convey an adequate idea without drawings, but the principle we have worked to and found to answer is to go to the seat of the trouble. It is far easier to catch 6in. of mud than 3ft. of spray.

COMFORT MOTOR CYCLE AND ACCESSORIES CO.,  
F. WAIGH.

#### An After-the-War Ideal.

Sir,—Much as one hesitates to disagree with such experts as "Ixon" and "Road Rider," I think their prophecies that the single  $3\frac{1}{2}$  h.p. machine is doomed to an early death will be falsified. Very many motor cyclists are not mechanics and hate "fiddling round" with their machines, and this class anyhow will always remain faithful to the single, which; however much the twin may be improved, must still remain the more simple engine.

There is one point about the price of machines that I could never quite fathom, and that is a single is generally sold for much about the same price as a twin of the same power, whereas one would have thought that the former must be considerably less costly to build.

I hope after the war more makers will adopt a grey finish as standard: not only is it far smarter, in my opinion, than the more usual black, but it shows dust and dirt less. That is, I think, one point where the Yankee makers secure many an order, for there is no denying that the Indian red and Harley grey finish are very attractive, whilst of English machines there are none to beat, and few to equal, the grey finish of the Bat. My *après la guerre* machine is going to be a Norton—if I can get the grey finish—although I rather hanker after the long belt drive of the Zenith: a feature I wonder more firms do not adopt.

In some ways motor cycle manufacturers must be a hide-bound lot, although there are exceptions. Take mudguards for instance: 90% of makers go on fitting year after year the same old totally inefficient guards with side wings, which hide the tyre and do not catch the mud, following on like sheep in the same old groove, season after season, in spite of the every-day vision of the unfortunate riders of their products covered from head to foot with mud and water because of mudguards (?) which do not guard.

I have had your paper posted to me regularly every week since I left England sixteen months ago, and I do not think a single copy has failed to arrive.

B.E.F., Salonika.

G. K. DAWSON (Capt.).

#### SUMMARY OF CORRESPONDENCE.

"A.A.S." (Bournebrook) writes that he made an omission in his last letter, and that the 4 h.p. Norton has a piece taken out of its flywheel rim.

# QUESTIONS AND REPLIES

A selection of questions of general interest received from readers and our replies thereto. All questions should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, London, E.C., and whether intended for publication or not must be accompanied by a stamped addressed envelope for reply. Correspondents are urged to write clearly and on one side of the paper only, numbering each query separately, and keeping a copy for ease of reference. Letters containing legal questions should be marked "Legal" in the left-hand corner of envelope, and should be kept distinct from questions bearing on technical subjects.

## Condenser Trouble.

**?** I have a 1908 magneto. I cannot run above 500 yards before my platinum points become burnt, and, of course, the engine misses fire very badly and soon stops. Would you tell me what the trouble is? I have a new armature in, and new points.—R.T.W.

Burnt platinum points are nearly always due either to a broken down condenser or to the points not being made of pure platinum. If the points prove upon being tested with acid to be of platinum, the only thing to be done is to have the magneto overhauled by a reliable magneto repairer.

## A Broken Chain Stay.

**?** I have cracked the stay, which runs from the bottom bracket to hub of back wheel, of my  $2\frac{3}{4}$  h.p. 1914 model twin. Can this be repaired by oxy-acetylene or other welding or brazing process? If so, would the member be as strong as before? (It occasionally carries a light sidecar.) The broken back stay is in one jointless piece with its fellow stay, the back forks and the lower portion of the frame.—F.H.

We should say that the stay in question could be welded, but, personally, we should prefer to have it replaced by a new one, or a new rear portion to the frame. This would be much safer, especially as a sidecar is used.

## The Liability of the Driver.

**?** A few weeks back I read in *The Motor Cycle* that if one takes a friend out in the sidecar and meets with an accident and the friend gets hurt he or she can claim damages, which seems rather hard, but I suppose it is the law. Now, since trade has not been so brisk, I have been taking people out at a charge of 3½d. per mile and extra for waiting; do you think it enough or too much? What I want to know in particular is—I have not got my machine insured against accident—if I get my customers to sign a paper to the effect that should I meet with an accident they would not claim on me, would this meet the case?—R.O.

The sum of 3½d. a mile is quite enough to charge, and at this figure we should say that you could afford to insure your machine against accidents and third party risks, which you certainly ought to do. The signature of a paper absolving you from responsibility would, we think, render you immune from claims, and

even if no paper were signed a passenger could only claim damages if he could show you were driving negligently.

## Broken Gearshaft.

**?** I have a 1912 Scott motor cycle, and of late have had the gear main spindle snap twice after only doing a few hundred miles. The fracture looks as though the balls had broken first and had then worn the spindle through close up to the cone till it broke. Could you make any suggestion as to why this should happen? I have fitted the new spindle myself, and wonder if I have omitted to perform some necessary operation.—G.H.

Undoubtedly the cause of the fracture is due to the broken balls. This may be due to the balls being faulty or to the cones being badly worn, or to their being insecurely fixed and screwing themselves up, so tightening the bearings that the balls were broken. In fitting the spindle see that the right-hand cone is screwed right home tight against the spindle shoulder. Then, after placing

the balls in their cups packed well with grease, the left-hand cone should be screwed up until the correct adjustment is obtained—that is, free running without play. Then lock this cone in position by means of the lock nut provided. When the gear is assembled in the frame make sure the securing nuts are tightened up well, and that the spindle is quite square with the engine-shaft. If these directions are followed there is no reason why trouble should occur.

## Knocking.

**?** I am running a  $3\frac{1}{2}$  h.p. (1914) three-speed machine fitted with a coachbuilt sidecar. I find that it runs perfectly on second and low gears, but on changing into "top" I cannot prevent knocking, although I shut off air and retard the magneto. The engine is perfectly clean, and the whole mileage does not exceed 2,000. Please suggest the cause and probable remedy.—A.H.M.

A slightly larger jet might cure the trouble, or you might try the effect of lowering the gear a little.

An outing was recently organised by the National Motor Volunteers for the benefit of wounded soldiers. A few of them are seen seated on the steps of the memorial erected to the memory of the first Earl of Cranbrook in the Kent village of that name. A 5-6 h.p. Ariel sidecar owned by one of the volunteers is shown in the foreground.

### Making a Pilot Jet.

**?** I am fitting a pilot jet on the carburetter of my motor cycle, and I shall be much obliged if you will answer the following questions: (1.) What size hole is required in the jet? (2.) Should the top of the jet and the petrol level be the same as the main jet in the carburetter?—W.H.C.

(1.) We should recommend you to start with a hole about .3 mm. or  $\frac{1}{1000}$  of an inch diameter, and enlarge this if you do not get the best results at first. The size depends upon the size of choke used. (2.) The petrol level should be just below the top of both jets.

### Knocking.

**?** My engine is suffering very badly from knocking. If the spark is retarded it runs all right on the stand, but it will not pull unless it is a trifle advanced, when it still knocks even when cold. It is a single-cylinder  $3\frac{1}{2}$  h.p. The bearings are all right. It has an automatic inlet valve, and B. and B. carburetter. Would early or late timing improve matters? The exhaust valve closes on the top of the stroke.—J.H.L.

If all the moving parts are in order and not worn the engine should not knock. This may be due to pre-ignition, caused by the use of an unsuitable plug with too thin electrodes, or electrodes which project too far into the cylinder, or the magneto may be timed too early. Too high a compression causes the engine to knock, but it would hardly be likely to be noticed until warmed up a little. A weak mixture will also cause an engine to knock. The valve timing appears to be correct.

### Acetylene Lighting Troubles.

**?** I have a F.R.S. Junior lamp set on my  $3\frac{1}{2}$  h.p. machine; the lamp will light all right, but when I go over a bump in the road it jerks out. Can you tell me the cause of this?

Also I have a rear light which is worked by the generator in front for the head light, and it is not at all satisfactory, as it will not light very easily, and when it is lit, blows out very quickly. Do you recommend a rear light which is worked by a separate generator or worked by the generator from the front lamp?—J.S.P.

The lamp jerks out because the rubber tube gets nipped somehow. The trouble may also be due to moisture somewhere in the system. Make sure all tubes are quite dry inside, also the burner.

The only objection to using a rear light from the main generator is that the length of tubing is occasionally apt to get nipped. You should use some discretion in installing the tubing; in fact, it is better to use metal tubing with short rubber connections, as nipping is then less likely to occur. When running the tail lamp from the same generator, the size of the head lamp burner may sometimes require reducing, otherwise there may be insufficient pressure to force enough gas through the small tail lamp burner. See that the tail lamp burner is not too large.

### Reducing Explosion Noise.

**?** I have a 7 h.p. twin motor cycle, and the expansion chamber which is in use does not seem to be sufficient to silence the explosions.

Will you be good enough to give me the dimensions of a good silencer which I could make myself (as I am a sheet metal worker), to replace the one already on my machine? The one I use now is a plain tube 8in. long, and  $3\frac{1}{2}$ in. diameter.—H.J.L.

The expansion chamber should be as large as possible. It is no good giving you the dimensions, as they must be governed entirely by the amount of space at your disposal.

Your expansion chamber should be as near the exhaust ports as is convenient, and there should be a fairly long extension pipe through which the gases escape. This may have a flattened end, and there may be saw-cuts in it at intervals. There is no necessity to have any baffle plates in the expansion chamber. We think you will find a simple silencer such as this as efficient as anything, provided it is made of stout material.

### IMPORTANT NOTICE.

#### GOODS MADE IN GERMANY.

The proprietors of this journal, being fully in accord with the recommendations agreed upon at the Paris Economic Conference, give notice that they will not permit the advertisements of new goods manufactured in enemy countries to appear in this publication, either during or after the war.

ILIFFE & SONS LTD

### Warming the Air.

**?** In order to improve the running of my flat twin machine I have been thinking lately of coiling a small copper pipe round the inlet pipe on both sides of the carburetter and connecting up to the silencer, the idea being that portion of the exhaust passing through the copper pipe would heat the inlet pipe and lead to better running. Looking at the illustrations in the article in your issue of November 9th I notice the A.B.C. engine has a pipe connected directly from the exhaust to the air intake of the carburetter. I had thought of doing this with my machine, but decided not to, for fear of causing fire in the carburetter. Evidently there is no fear of this, but I should be glad if you would let me know if I should be quite safe in coupling up a small copper pipe from the rear exhaust pipe to the hot air-intake of the Douglas carburetter, and if you think this would give me as good results as heating the inlet pipe in the manner described above. The latter would be the more troublesome job of the two.—F.W.W.

The idea of coiling a copper pipe round the inlet is quite good. You will find this will heat the portion in which there is great cold, due to the vaporisation of the petrol, and the warming is bound to have an advantageous effect, both as

regards economy and flexibility. You have been deceived as regards the A.B.C. hot air pipe. This is not connected to the exhaust. The pipe has a dead end, but there are holes drilled close up against the exhaust pipe. The air inlet pipe becomes hot through conduction, and the air as it enters these holes is warmed by the hot pipe, and is nicely warm before entering the carburetter. It certainly looks as if the exhaust gases were taken straight into the carburetter, but this is not so. Also, if you take the exhaust gases straight into the carburetter air intake you would upset the mixture badly.

You may connect a pipe from the air intake of your carburetter close up to the radiating fins, and this will also help matters a good deal. We should recommend you to fit whichever device is the simpler for you, or both could be used.

### Flaming Exhaust.

**?** I have recently purchased a 6 h.p. twin outfit. Upon trying to start it I experienced considerable trouble in getting it to go.

Eventually, when started, it did so with a roar, and refused to stop when the throttle was closed. Flames appeared to pass down the exhaust pipes, causing them to become red hot, also the cylinders. Is it right for flames to pass down these pipes and cause them to be red hot? Also why does the engine not respond to the throttle?—T.S.

The exhaust gas is always in the form of a flame, but if the engine is in really good tune it is almost colourless and not very long. It should not cause the pipes to glow. An over-rich mixture will cause the exhaust flames to be of a red colour, instead of an almost invisible blue; this will cause the engine to heat up unduly. If the spark is retarded the flame will extend for a much greater distance down the exhaust pipe, and will cause the engine to overheat. The reason for the engine refusing to answer the throttle is probably due to grit having caused the throttle piston to jam. Remove the carburetter slides, and see that they are quite clean and working freely.

### RECOMMENDED ROUTES.

#### LEICESTER TO CHESTER.—M.S.

Leicester, Ashby-de-la-Zouch, Burton, Uttoxeter, Stone, Pipe Gate, Nantwich, Tarporley, Chester.

#### LLANDUDNO TO BIRMINGHAM.—C.W.C.

Llandudno, Abergele, St. Asaph, Mold, Wrexham, Whitechurch, Newport, Weston, Gailey, Brownhills, Erdington, Birmingham.

#### IBSTOCK TO BEDFORD.—C.S.H.

Ibstock, Hincley, Smockington, Lutetworth, Thornby, Northampton, Olney, Turvey, Bedford. The distance is approximately 69 miles.

#### FOLKESTONE TO IPSWICH.—A.W.P.

Folkestone, Sandgate, Hythe, Ashford, Charing, Maidstone, Wrotham Heath, Meopham, Gravesend, by ferry to Tilbury, Billericay, Chelmsford, Witham, Colchester, Ipswich. Approximately 116 miles.

**T**HE Sturmey-Archer Countershaft Gear is something quite unique. It has been tried and proved. It has been and is in regular use in the war on all fronts.

It differs radically from ordinary variable gears—just as much as the Sturmey-Archer has always differed, in being something a little better made, a little better in theory, a little better in practice, and a great deal better in results.

Until after the war it must remain a prerogative of the fighting men. You won't begrudge that. They must come first.

But after the war the Sturmey-Archer will be ready for everyone and it will be everyone's choice. This is no vain boast. Ask the men at the front. They KNOW. Their lives have often depended upon it.

Meanwhile, just note the address: Sturmey-Archer Gears, Ltd., Nottingham.

You'll want it when the war's over.

**STURMEY ARCHER**  
COUNTERSHAFT GEAR

The British

# EXCELSIOR

## The Ideal Machine for Town or Country

**T**HE Ideal Machine for either Town or Country is the thoroughly British "Excelsior" Two-stroke  $2\frac{3}{4}$  h.p. It is simple in construction and very easy to control. Solidly built, and as reliable as it is possible for a Lightweight to be. Above all, it is very inexpensive to run.

**Price,** Two-speed Model,  $2\frac{3}{4}$  h.p. (as illustrated) - - £44:2:0  
Single Speed,  $2\frac{1}{4}$  h.p. - - - - - £32:10:0  
Two-speed, Two-stroke,  $2\frac{1}{4}$  h.p. (no Clutch) £39: 5:0

Sole London Agents: H. Taylor & Co., Ltd., Store Street, W.C.

*In answering these advertisements it is desirable to mention "The Motor Cycle."*

# MISCELLANEOUS ADVERTISEMENTS.

## PRICES.

ADVERTISEMENTS in these columns—First 12 words or less 1/6, and 3d. for every two words after. Each paragraph is charged separately. Name and address must be counted. Series discounts and special terms to regular trade advertisers will be quoted on application.

Postal Orders sent in payment for advertisements should be made payable to **LILFE & SONS Ltd.**, and crossed **& Co.**

All advertisements in this section should be accompanied with remittance, and be addressed to the offices of "The Motor Cycle," Hertford Street, Coventry. To ensure insertion letters should be posted in time to reach the offices of "The Motor Cycle," Coventry, or London (20, Tudor St., E.C.), by the first post on Friday morning previous to the day of issue.

All letters relating to advertisements should quote the number which is printed at the end of each advertisement, and the date of the issue in which it appeared.

The proprietors are not responsible for clerical or printers' errors, although every care is taken to avoid mistakes.

## NUMBERED ADDRESSES.

For the convenience of advertisers, letters may be addressed to numbers at "The Motor Cycle" Office. When this is desired, the sum of 6d. to defray the cost of registration and to cover postage on replies must be added to the advertisement charge. Only the number will appear in the advertisement. All replies should be addressed, "No. 000, c/o 'The Motor Cycle,' 20, Tudor Street, E.C."

## DEPOSIT SYSTEM.

Persons who hesitate to send money to unknown persons may deal in perfect safety by availing themselves of our Deposit System. If the money be deposited with "The Motor Cycle," both parties are advised of this receipt.

The time allowed for a decision after receipt of the goods is three days, and if a sale is effected we remit the amount to the seller, but if not we return the amount to the depositor, and each party to the transaction pays carriage one way. For all transactions exceeding £10 in value, a deposit fee of 2s. 6d. is charged, when under £10 the fee is 1s. All deposit matters are dealt with at Coventry, and cheques and money orders should be made payable to Lilfe & Sons Limited.

The letter "D" at the end of an advertisement is an indication that the advertiser is willing to avail himself of the Deposit System. Other advertisers may be equally desirous, but have not advised us to that effect.

## SPECIAL NOTE.

Readers who reply to advertisements and receive no answer to their enquiries are requested to regard the silence as an indication that the goods advertised have already been disposed of. Advertisers often receive so many enquiries that it is quite impossible to reply to each one by post.

## MOTOR CYCLES FOR SALE.

## IMPORTANT NOTICE.

Owing to the Christmas Holidays, the issue of "The Motor Cycle" for Dec. 28th must be closed for press earlier than usual. All copy and instructions for Miscellaneous Advertisements in that issue must therefore be in our hands not later than first post on Wednesday, Dec. 20th.

## DEFENCE OF THE REALM ACT

Under the provisions of the above Act, advertisers requiring workmen, and whose business consists wholly or mainly of engineering or the productions of munitions of war, or substances required for the production thereof, and whose works are situated within 30 miles of London, must include in every such advertisement the words, "No person resident more than 10 miles away, or already engaged on Government work, will be engaged."

Advertisers whose works are situated more than 30 miles from London can only have their announcements inserted with the approval of the Board of Trade, who will allocate to each advertisement a box number, and collect and distribute to the advertiser all replies received. The necessary forms of application can be obtained from any Labour Exchange or from the offices of this paper, and each advertisement must contain a clear reference to the effect that no person already engaged on Government work need apply.

## SPECIAL NOTICE.

The Ministry of Munitions has given us permit to supply any motors, erected or assembled up to the 15th February, 1917. If Agents, therefore, are desirous of securing motors which we have coming through the works they could be delivered before that date; after that date we expect no more motors can be supplied for the English market.

### A Third War Christmas.

IT would be an irony to wish any reader a happy Christmas in these troublous times, when so many near and dear to us are fighting the common enemy. The best we can hope is that, after our task is accomplished and "adequate reparation for the past and adequate security for the future" are assured, we shall all be peacefully and happily re-united by Christmas 1917. In the meantime, we extend our heartiest greetings to all readers at home and abroad, and sincere wishes for a successful conclusion of the war in 1917. May the thoughts of a happy re-union at Christmas next year prove an additional incentive to renewed efforts. Peace is impossible with a nation unbroken which has made a study of war for over forty years past, and has even taught war and militarism in its schools and churches. When the object with which the Allies entered the field in 1914 has been achieved we may look forward to happy times a-wheel, and the renewal of our ordinary and peaceful avocations. Here's to success and a safe return!

### Two-stroke Lubrication.

THE system of lubricating two-stroke machines, it is generally agreed, is not yet on a satisfactory basis. Proof of that fact lies in the number of different methods of lubrication adopted by the various producers of two-stroke engines. It is almost unnecessary for us to point out that a perfect system of lubrication is more desirable—if such a remark is permissible—in the case of a two-stroke than in the case of a four-stroke, as the former engines are usually of small size, and for the greater part of their life work almost up to their limit output. Again, carbon deposit is more apt to form in these engines with detriment to the piston rings and, of course, the compression, largely due to the extra heat generated by the double explosion. It is a

subject we have discussed at different times, and have at various periods offered suggestions, as the result of prolonged riding experience with such machines. The petrol system is at once the most foolproof and attractive method of lubrication evolved, and is entirely in keeping with the simplicity of the machine as a whole, but it has its shortcomings. Messiness is its main defect, as it detracts from that smart and workmanlike appearance of the two-stroke light-weight of typical British design. When petrol is mixed with oil the vibration to which the carburetter is subjected causes the fluid to collect on the top of the float chamber. In time the petrol evaporates, and so leaves a yellow sticky mess in the region of the carburetter. Dust and dirt collect on this, with the result all users know only too well.

Two years ago, in dilating upon this subject, we suggested that the throttle-controlled lubricator is surely ideal and perfectly automatic, relieving the rider of all lubrication worries. We went on to state that from these considerations alone it was to be hoped that some discovery would be made that would overcome the objections outlined. On this subject, it is not without interest that we are at the present moment riding a two-stroke machine fitted with a throttle-controlled lubricator, the details of which we must refrain from divulging at the present time, for the simple reason that duplicates cannot be produced owing to war demands. This design, however, is not the only one of the type, for of late months we have seen three designs of throttle-controlled lubricators specially designed for two-stroke machines. Thus it will be seen that, though progress, so far as the ordinary riding public is concerned, may be comparatively slow and almost indiscernible, the fact remains that behind the scenes there is a good deal of experimental work quietly in progress, all of which will be to the general good of the pastime and trade when the glorious days of peace return.

### Our Toolbags.

Not long ago I fitted up a couple of new machines with my favourite kit, and as usual got into difficulties at once. One of the pannier bags was not unreasonably fully occupied by the tool roll, and as the tool-roll contained a good set of ordinary weapons, I had no quarrel with it. I then laid out on the bench the goods destined for the remaining pannier—delivered empty, but carefully sealed by some humorous packer, who presumably wished to play a trick on railway thieves. The assortment comprised a tyre repair outfit, two spare sparking plugs, a valve removing tool, two spare valves (the engine in question has inlets which differ from the exhausts), a spare chain and links, a belt punch, and a lamp burner. Not an excessive catalogue, but they would not go in anyhow. In particular, the tyre repair outfit could not be coaxed into the pannier, even when the latter was empty, and three of other makes were equally reluctant. I do not know whether we should blame the pannier maker or the repair outfit maker, but the fact is that every year fewer and fewer makers supply tyre repair outfits with their bicycles, and as a consequence touch is being lost between the two. So I am actually driven to mount two small leather wallets on my handle-bars, one holding two spare plugs, the other a repair outfit. I do not see why pannier toolbags should not be much larger than they are; after all, we are not compelled to fill them with anything heavier than cotton waste, if we prefer to travel light.

### Ugh!

I must not grumble, for I have had very few punctures during the last two years, but when the spell of luck broke of course I got a really shocking puncture in inky darkness and pouring rain. The tyre, as you will expect to hear, was a brand new gin. with steel studs in the tread, and as stiff and unmanageable as it could be made. There was no divided axle, no handy railway bridge or barn, and my supply of carbide wasn't excessive. There were no tyre levers in the standard kit, nor in the repair outfit. I draped my oilskin neatly over the back wheel to keep the tube as dry as possible, crept into the tent thus improvised, propped my head lamp to throw a fitful glare on the job, and turned the water as low as possible. Wiping my hands dry and clean, I gouged the reluctant cover off the rim at last with the aid of a stumpy screw-driver and two or three stamped spanners; by this time, of course, my hands were wet and gritty, as the whole tail of the machine was drowned in mud. There is only one worse experience in motor cycling, and that is tackling the same job in a blizzard, and the worst of it is that there is no cure for it; it is still a rotten job even if you have a drop-out wheel and a spare tube. Thank goodness, it is far easier than it used to be, for there was a time when tyre solution wouldn't stick unless it was treated delicately, whereas modern solutions dry quickly and stick closer than a dun.

AIO

### An Imported Sparking Plug.

One of my most treasured possessions is a cheap imported sparking plug with two hook electrodes of very thin wire. I am afraid I was rather rude to the agent who sold it me, but I bought it when one cylinder of my twin was sooting badly, in the days when British makers were choked up with Government work, and the vendor had nothing else in stock. I soon learnt its value and its limitations. If I put it in a baby two-stroke or a high-efficiency T.T. mount, it grew red hot in a very short distance, and terrific pre-ignition would set in on the first long hill; so it went on the shelf one day, and I pigeon-holed it in my memory as one of the hottest plugs I had ever struck. Before long I was in trouble with another twin, equipped with a low efficiency engine and an oily back cylinder. Several expensive standard British plugs were being paraded for a good scrub after short service in that oily back cylinder, when my eye fell on the weedy-looking electrodes of the discarded foreigner. Methought it was just the sort of little beast to keep itself burnt clean in that exacting cylinder; and so it proved.

### The Future.

I may be wrong again, as I have often been wrong in the past, but I cannot help thinking that, unless considerable extension of the decarbonisation intervals is possible, the simplicity of this job will exercise a marked influence on the survival of certain types of engine. If I may take leading names in vain, let us suppose that in 1925 A.D. the Douglas and Triumph firms are both producing 8 h.p. sidecar outfits; that any duffer can decarbonise the one make in an hour and a half, whilst the other represents a whole day's work. In 1925 A.D. the two outfits would sell on their makers' past reputation. In 1926 A.D. the quick decarboniser would begin to forge ahead; and in 1927 A.D. the clumsy decarboniser would fall far away in the rear on sales statistics, unless it was improved in the meantime. Now it is apparently certain that the thumping big V twin can never be decarbonised very simply and quickly unless it is, for example, fitted with a bolted-in top tube to the frame, so that the whole of the top hamper can come away quickly, and leave the cylinders clear to be lifted off. It is easier, but still not really easy, to design a big horizontal twin so that its cylinders whip off smartly. Of course, as the super-efficient engine is developed, the thumping big twin may be eliminated altogether in favour of a "revving" small twin. If this does not happen, I wonder if the four-cylinder will come into its own? Imagine a four-cylinder, set rather low in rather a deep frame. Fit it with a detachable cylinder cover, and with overhead valves. Add, if you like, a second joint lower down between the *monobloc* cylinder casting and the crank case. It will be difficult to design a twin of the same c.c. to equal this for general handiness and accessibility.

## A MESSAGE TO OUR COMRADES AT HOME AND ABROAD.

Hearty Greetings for Xmas, 1916  
and Best Wishes for  
the Ensuing Year.

MAY Christmas Nineteen Seventeen see you all re-united in glorious peace, having fulfilled your Country's service in France, The Balkans, Egypt, Mesopotamia, East Africa, "At Sea," or at home in "Blighty."

MAY the advent of the New Year find you as resolute and determined in your fight for the right, and carrying on in true British fashion, with the knowledge that our hearts are with you all the way.

MAY you be inspired to still greater deeds.

MAY you, who have provided such admirable material for all the specialised sections of our gallant Army—whether in the air, on land, on sea, or under the sea—may you return safe and sound to the joys of the open road astride a motor cycle, exhilarated by the knowledge of a deserved victory hardly won, to "rev" on unlimited petrol and with unrestricted lighting.

These are but a tithe of the Good Wishes we would convey to you.

HERE'S TO OUR NEXT MEETING!!!

## NIGHT DUTY.

A Despatch Rider's Initial  
Experience of Night Riding in  
France.

THE sergeant looked into the motor cyclists' billet and shouted, "Where's 'Udson?" A long, lean youth got up from his kitbag and replied, "Here, sergeant." The other D.R.'s looked round with interest.

"You're for night duty to-night," said the sergeant. "Morgan's gone sick, so you'll have to take his place."

"Righto, sergeant," said the long youth, "when do I start duty?"

"You report to the Signal Office at ten o'clock, fully dressed and ready to go out. And don't be late, mind you, or there'll be trouble."

The sergeant walked out of the barn, and the other D.R.'s returned to their magazines and letters. All, that is, save one, a fatherly individual, who had been on duty the night before. He lit a cigarette with great deliberation and gazed on the tall youth, who was a new-comer to the section.

### Wasted Sympathy.

"Poor devil," he said, with intense feeling.

The new-comer, No. 87,501 Motor Cyclist Corporal Hudson, J.E., was surprised. He was still full of that vim and enthusiasm which is characteristic of new arrivals in the land of France, Army area. Everything to him was so strange and interesting. True, it was rough at times, but this was a thing for which he was prepared, and the novelty and excitement more than compensated for it. He could not understand the boredom of his companions, nor yet their remarkable agility when it came to avoiding work. So he was surprised when a comrade sympathised with him, merely because he had a hard night's work in front.

"Why, what's the matter," he exclaimed, "everyone's got to do night duty sometimes, I suppose? I'm not frightened at taking my turn with the rest."

The fatherly one grunted.

"Maybe not," he replied, "but you don't know what you're in for, my boy. If you did you wouldn't be quite so pleased with yourself. I had it last night: it poured with rain all the time. To-night it'll be worse."

"Why's that?" queried Hudson; "it hasn't rained since this morning, so——"

"That's just the reason why it'll be so bad to-night," replied the other. "Yesterday it was wet; to-day it's been fine. The roads are getting dry now. To-night they'll be sticky. You haven't been on the roads here when they're really sticky. The mud's so thick that it absolutely clogs up your wheels. You can't go 200 yards without getting off and clearing out the mud. You'll see what it's like all right. And

there's no moon—won't be any stars either, for the amount of cloud there is about. You're in for a picnic, mark my words. And don't say I didn't tell you."

### Where Ignorance is Bliss.

"Oh, well, if that's all I needn't worry much. Many a time at home I've ridden without a lamp, and had the police to dodge as well. I'm not afraid of things like that. We'll have worse to put up with if we get to moving warfare again."

"Cut it off," said the fatherly one. "We've heard all that stuff before. You get it for a ha'penny a day in the *Daily Mail*, along with a bit about 'horrors of war' and 'gallant lads.' I've been out since Mons, that's over two years now. You won't buck so much in the morning."

The conversation had taken place in the tumble-down barn that was the billet of the motor cyclist despatch riders of the Tenth Division. Hudson had arrived from the base two days before. Like all others of the "just out" variety, he was keen to prove his worth. Every job that was put before him he performed with alacrity and despatch. He held exalted opinions on doing odd jobs to help other people, and was always to the front when there was a long run to be done. The old hands had seen many of his type. As a rule their energy lasted about a week, sometimes a fortnight, but never more. These first few days after the arrival of a reinforcement from the base were good times for the old hands. Morgan, had he not gone sick, would probably have persuaded Hudson to do his night duty for him in any case.

Hudson, clad in oilskins, mufflers, and Hutchinson waders, presented himself at the Signal Office on the stroke of the hour. The signal master, who was accustomed to waking a bored "night man" at about 10.30 p.m., was surprised at his punctuality and enthusiasm, for the D.R. seemed almost disappointed to hear that there was nothing important to be taken out.

"Don't you worry, sonny," he laughed, "you'll be out before the night's much older. There'll be some "specials" for brigades about midnight, unless I'm much mistaken. Know the way to the brigades all right?"

"Yes, thanks," said Hudson. "I went over them all this afternoon. Well, I suppose I'd better make myself comfortable."

### A Start for Brigade Headquarters.

He selected a packing case, and, placing it against the wall, settled down till such time as his services should be required. His glance wandered from the signal master to the operator at the telephone exchange,

**Night Duty.—**

and on from him to the Morse operators seated in front of their polished brass sounders. Each bore on his face the dull contented look of the man who has done a **thing** a hundred times before, knows exactly what **will** happen, and exactly how long it will last. They, poor devils, thought the despatch rider, had got a sickly, monotonous job. They were doing, under somewhat unpleasant conditions, exactly what they had always done in civil life before the war—at less than half the pay. He, on the other hand, was working at his favourite pastime—motor cycling, and being paid for it, to boot. That was where the difference lay; that was why he was so keen on his job, whilst these others were “bored” to a man.

A clerk walked into the Signal Office towards midnight carrying a bundle of official envelopes. He tossed them on to the signal master's table, muttering “Three specials.” Then, grumbling about the lateness of the hour and the pressure of work on hand, he departed into the outer regions.

The signal master looked through them lazily, and entered particulars of them on the “Register for Outgoing Messages.” He made out a “Despatch Rider's Docket” in triplicate, and tore off the two top copies. These he handed to Hudson, who signed the remaining copy, gathered up his despatches, and went off to his motor cycle. He soon had the engine running, and was bouncing over the abominable road towards the nearest Brigade Headquarters.

It was one of those nights which is dreaded by all road users in Northern France. The roads were in the most appalling condition of mud—thick, sticky mud, which clung to the tyres and filled up the mudguards so that the wheels could scarcely turn. Added to this was considerable traffic on the roads, horses frightened and plunging, men shouting and swearing; and it was black as pitch.

**The Awakening.**

Hudson had not gone many hundred yards before he realised that the Fatherly One had spoken solid truth. His machine was slipping and sliding from side to side of the road. With feet out, he could just keep it upright. Progress on top gear was impossible—it was a struggle to get along on second or first; and he could not go more than 200 yards without dismounting to clean the wheels.

There were difficulties before him of which he had not thought. In the main it was the traffic which disturbed him. Given a clear road he could have held

up against any amount of mud and darkness. But the continuous stream of “limbers,” water carts, “G.S. waggons” and the like went a long way towards breaking his nerve. Every second he was having hair-breadth escapes; each skid was rendered fifty times more dangerous by the congested traffic and horses about him.

At last, however, he came to a clear stretch of road. He cleaned out his wheels at the beginning of it, and congratulated himself on having reached a road where he would be able to proceed at more than three or four miles an hour. It was dark, of course, but the direction of the road was clearly outlined by the rows of trees on each side, which stood out blacker than the sky above. Hudson opened his throttle slightly and changed up into top gear.

But many are the traps for the unwary. Horses and waggons, to be sure, he had left behind, but motor cycles and cars coming in the opposite direction still had to be reckoned with. A car bore down upon him at reckless speed. Involuntarily he stamped on the brake; he swerved, skidded, and came heavily to the ground. The car twisted away to the right, missed him by six inches, and disappeared. Hudson picked himself up and shifted his machine to the side of the road to count the damage. Then, finding that little or none had been done, he started the engine and continued on his way.

Presently he heard a most weird and uncanny noise above the beat of his engine. The noise of the latter made it impossible for him to define or locate it; but with a care gained by his previous fall, he changed down to low gear and proceeded warily. The noise now became more distinct. There was a hiss, a whistle, and a shower of sparks rose in

the air. He was riding into the back of a train.

**A Narrow Escape.**

To those who are accustomed to the wayside trains of France there is nothing so very alarming in encountering one at night, but to the new-comer it is the most frightening experience. This particular train was moving in a series of jerks at a speed of something under two miles an hour, but, save for occasional showers of sparks which showed it to be somewhere on the right it was almost invisible. And Hudson, in giving it a wide berth, had to risk being run down by any approaching vehicle.

But, somehow, he got past it, and, somehow, he reached the headquarters of each of the three brigades. Similarly, “somehow” and with many

“This particular train . . . save for occasional showers of sparks . . . was almost invisible, and Hudson . . . had to risk being run down by any approaching vehicle.”

## Night Duty.—

narrow escapes, he reached Divisional Headquarters and walked into the Signal Office, more wise and tired than he had walked out. The signal master greeted him with a grin.

"Had a rough time, sonny? Thought you would. It's bad going, these dark nights."

"By gad it is!" said Hudson, and tumbled down on to his packing case, half exhausted. "A few more runs like that would do me in."

The signal master laughed.

"You'll have lots worse than that before the war's over, my boy," he said. "And I suppose I shan't cheer you up over much when I tell you that there'll be another special for all brigades in about half-an-

hour. The 'G' branch clerk has just been round to warn me."

"Good gracious!" said Hudson.

\* \* \* \* \*

"Well," said the Fatherly One, "how did you enjoy your night's work? Cushy, eh?"

"It was rotten," said Hudson, briefly. "I never thought anything could be like it."

The Fatherly One laughed.

"No, my boy, I didn't think you did. And no more do all the blighters who say motor cyclists have got soft jobs. We may not get shelled or sniped much, but we *do* stick it. And when you've done about two years of the sort of riding you had last night—well, you get to know something about motor cycling, eh?"

## ODES ODIOUS AND PARODIUS. No. 13751.

### A TALE OF TWO TRIUMPHS.

#### I.

*She* : I have a song to sing, oh.

*He* : Sing me your song, oh.

*She* : 'Tis the tale of a Tyke  
And a motor-bike,  
That was blissfully bowling  
along, oh.

'Tis the tale of a Triumph's purr  
and puff,

'Tis the lay of a lap-dog's larboard  
luff

In a scurry to 'scape with scathe-  
less scruff

From a puffer propelled by petrol.

Heighdy, heighdy! lacka-  
daisy! misery me!

Pity the pup with a larboard luff  
Polished off by a puffer of petrol!

#### III.

*She* : I have a song to sing, oh.

*He* : Sing me your song, oh.

*She* : A tale I tell  
Of the fate that befell  
The rascal who wrought this  
wrong, oh.

'Tis a song of the reading of marriage  
banns—

(The mongrel-murdering motor  
man's

And the girl's who'd grieved for the  
ghost that fled

From the colloped corpse of her  
doggie dead,

To the tune of a Triumph's purr  
and puff,

In spite of his luckless larboard luff  
And his scuttering scurry to save  
his scruff

From the puffer propelled by petrol.)

*He* : Heighdy, heighdy! lackadaisy!!  
misery me!!!

I'm in place of the pup with the  
luckless luff  
Polished off by my puffer of petrol!!!!

#### II.

*He* : I have a song to sing, oh.

*She* : Sing me your song, oh.

*He* : 'Tis no song for a cyn-  
ical soul; therein,  
A thousand threnodies  
throng, oh.

It takes for topic the teardrops shed  
By a maid dismayed at her doggie  
dead,

To the tune of a Triumph's purr  
and puff,

In spite of his luckless larboard luff  
And his scurry to 'scape with scathe-  
less scruff

From that puffer propelled by petrol.  
Heighdy, heighdy! lackadaisy!  
misery me!

She pined for the pup with luckless  
luff,  
Done to death by that puffer of petrol.

The following article is purely imaginary, being contributed by a motor cyclist who has never seen a Zeppelin, never made an aeroplane ascent, and has no connection with, or knowledge of, the Flying Services.—Ed.

**Z**EPPE crossing, are they? That means a cold job for me, anyway. Thank heaven for a decent 'bus. No fog either. Fog's the devil on this game. Alister got on top of one of them last raid, and nearly loosed off everything on her, fancying he was over the water; then a rift opened in the mist beneath, and he said it was a toss-up whether she'd have come down on a cathedral or a munition factory. Then he lost her in the fog; then he lost himself, and had about a pint of petrol left when he spotted the aerodrome signal 6,000 feet below. Talk about sport! Dog's life, I call it. Well, here goes for a messy death or the D.S.O. "Contact?"

6,000 feet, eh? What's the time? Another ten minutes if the reports were anywhere near right. Better wait at 10,000 feet, I suppose, and get a dive at her. Wonder if she'll be the new type with a gun on top. I'd rather ram her than miss her. Guess she'd buckle if I punch her amidships with a 4,000 feet run at 120 m.p.h. She's about due now. Must get my nose round—facing seawards. Nothing doing yet. Better make another spiral. *Gosh!* That was close. Who was it? Alister, I suppose. Wish he'd keep over his own side; this is my beat. Hello! Searchlights at last. What's the good of my climbing for a dive if those silly fools will blaze their beastly beams right in my eyes, and blind me for ten minutes. See anything, Hugh? Fool I am—who could hear the last trump with my engine running like the peach she is?

Wish I could paint. Some Johnny will get his R.A. for one of those fleecy clouds with searchlights playing on it from the bottom side. Happy thought—go and hide in that cloud; it's just about the right level, and the Zepp won't see me so easily if the cloud's thick enough to blanket our searchlights. Whoosh! It's some cold. Cloud's too beastly thick. Can't see a thing. Don't know whether I'm right side up or sideways. What's Hugh slugging me for? Can he

see her? Finds this cloud a bit damp, I suppose. Let's get out. Searchlights still wandering. Silly fools think they're whitewashing the sky, instead of looking for Zepps. What's that? Zooks, they've found her. Seven thousand, I should say, perhaps eight; and say three miles. All the beams on her now. She can't possibly see me. What's my best game? Keep up, anyhow. Right up, I should think. What's she over? There's the — mark. Whew, she's bang over X—, and doesn't know it; she ain't dropping anything. Steering due west too. Open land out there. Shall I cut her line and dive at her? It's a chance before she sights me—one of those beastly beams is sure to show me up soon, or she may cut out her engines, hover and listen for us. What's she doing? Sixty? Seventy? Not more anyhow. No-o-o. I don't think. How's this? Keep right up, curl round behind her. Dive down on her stern in her line, and loose the whole blessed tray of ammunition right along her back. Bound to get one home; and if she's a gun on top and wings me, why, she'll just get the beak of this old 'bus where her hair is short, and that'll be as good as a bomb any day. Keep those — beams off me, you fools down there. Pretty mess there'll be if Alister is on the same lay, and doesn't see me. He curls in from the south, I curl in from the north, and whichever of us is bottom dog takes *the other's bombs*. Well, we shall be in the beams long before that, so here goes.

I reckon my course is just about dead parallel to hers, now. Mustn't keep on it long. Suppose she's coming to meet me at sixty, and I'm meeting her at sixty, a minute will just about do it. Then I bank south, line on her, and dive. Mustn't mull it, or she'll be out of the lights. That glow on her hull means the cabin lamps are going, but I shan't see them from upstairs. If I miss her in the dive, what's next? Run alongside, and let Hugh try his gun. Poor look out that. She'll have three guns on her broadside, and bigger ones than ours. No. Let her run on till she gets into the searchlights at —, and then try another stern dive. We *won't* miss.

**Bringing Down a Zeppelin.—**

There she's nearly up level now. Say 4,000 down. Time to bank. I guess Hugh's jumpy. We'll be doing 120 in a minute, and he'll have to loose off to the tick, or he'll only singe her nose or her tail. A bit more to port, old girl. Dead on her line now. Another half-mile, and down we go. Now then. Up with everything. Keep those beams steady, curse you. Oh, dear! the gunners are starting on her. Well, it'll be rotten shooting if they hit me till I'm all but on her tail. Wonder if she's got a gun on top. Soon know, anyhow. — that beam. M'yes, a battery, I should think. No, it's only one. Coming his fire, is he? Drilling holes all round me by the zips. Well, so long as he doesn't hit a stay, he's only got about another half second in this world to practise in. STEADY, old girl!

Wish our explosives were a leetle less hefty. That shell just about capsized us. Of course, if it had hit the Zepp., it would have been a dud right enough; but as it fizzed off just under my right-hand plane, it was a never-wozzer. Now I shall have to climb and find her again. No searchlights for ten miles. She's 3,000 feet above me, and going full throttle with a tail wind. Bet Hugh's some sick. Thought our number was up, too. Get my nose up, and look for her cabin lights. What's that? Good biz. She's winged. She's stopping. No! Something up, though. An engine or two out perhaps. Where's Alister? Almost as soon he got her as I. Now, old girl, climb, climb, climb! She's off again, too. Turning, eh? Good gracious! why can't the brutes keep a course? How am I to apply tactics to a drunken Zepp. pirouetting like Adeline Genée at 6,000 feet? Has she spotted X—? Is she taking her bombs back there? No, I believe she's running. They've hit her somewhere, and she's taking no risks. Out to sea, that's her game. Oh, the cads! Loosing off every bomb they've got on the off chance of hitting a few kids and women. Nothing but farms under there, though, and pretty thin at that. She'll only save Hodge a little ploughing to-morrow. Get on a course, Fritz, my friend, and then I'll lay mine. Till then, up, up, up.

Yes, Fritz, I see. A bee-line for the North Sea, is it? You don't know I'm above you, do you? Above and behind. Straight behind, it'll be in a very few moments, my babykilling friends. Now when shall the strafing begin? Rather hard to pick up the signals at X— at this pace. May be five miles of open country, may be two. Better let her get over the water. Sure to be lights there by now. Anyway, the mist's clearing. I shall see her against the sea at the worst. Yes, we'll keep up, and dive when she crosses the coast line. Plenty of time—time to tell Hugh the game. (*Writes and passes back to observer.*) "I dive along her back when she clears the harbour. Twig?"

Here's the sea. We're lined straight on her. I'll dive in a thousand yards from now. Not too fast, either. The slower I go, the better Hugh's chance

with his pills. What about that gun, too? We've lost some bits of rigging already. If I dive fast enough, the rush means a ram, even if their gun gets home on us again. M'yes, pretty fast will pay, I think. Here goes. Hugh! Now!

BANG!

Golly! Sticking on a bucking broncho must be child's play to that I think. Shouldn't think I've an eyebrow left. Regular sheet of flame. Poor devils! It's a dog's game, and a dog's death. They wouldn't get our boys to do it. Rather a-sell if we smash up now. Never did like night landings. Wonder if I'd better climb a bit first. Don't know where we are—rather too low to be pleasant. The old 'bus feels a bit shaky, too. That gunfire must have carried away a decent few wires I fancy. Won't Alister be sick? Perhaps he's got one too; the brutes generally hunt in couples. Ah, there's the signal. What a bit of luck—no mist, either. Funny thing, never felt so jumpy coming down before. Would be rotten to pile her up to-night of all nights. Steady does it, old girl—that's it. Well, boys, some flare, wasn't it?

**A SURE SIGN OF CHRISTMAS!**

In some of the old-world villages flocks of geese were frequently to be encountered during the past month. Sad to relate, there is a distinct probability that the majority are new hanging on poultry hooks!

BRINGING DOWN A ZEPPELIN. (See pages 535 and 536.)

## THE A.B.C. INJECTOR CARBURETTER.

An Automatic Carburetter on New Principles, Vertical or Horizontal at Will.

**A**LL carburetters, automatic or hand-controlled, have two principal difficulties to overcome. What is commonly called the suction on the jet is really the difference in atmospheric pressure in the induction pipe and above the petrol in the float chamber. The force which causes petrol to spurt from the jet is the pressure just referred to (and not suction at all), but it would have no effect were not the pressure in the induction pipe and in the carburetter above the jet not reduced by the action of the piston. As the speed of the engine increases the difference in the two pressures becomes greater, and therefore a larger quantity of petrol flies from the jet. It is true that a larger amount of air enters at the same time, but the air does not increase in the same ratio as the petrol, and the gas therefore becomes too rich. This is the first difficulty. In a hand-controlled carburetter, as every motor cyclist knows, this inequality is adjusted by means of the hand lever controlling the extra air and allowing more air as the speed increases. In some carburetters, known as semi-automatic, the throttle also controls the air to some extent.

### Throttling Down.

The second difficulty is that of maintaining sufficient suction (we use the popular term for the sake of convenience) on the jet at low speeds with the throttle nearly closed. The throttle being in most cases between the jet and the engine causes a great difference in atmospheric pressure in the induction pipe and above the jet, consequently the petrol does not issue from the jet in sufficient quantity to produce a satisfactory mixture. In the hand-controlled carburetter the extra air supply would now be cut off and a sufficient head of petrol thus obtained. The designers of automatic carburetters attack these two difficulties in a variety of ways, the methods adopted in the new A.B.C. carburetter being as follow:

### A Double Choke Tube.

In the A.B.C. carburetter are two choke tubes, one situated inside the other in such manner that, as the speed of the engine increases, the outer choke tube injects an increased quantity of air into the inner, and, as the jet is situated in the latter, the pressure round the jet, which would otherwise be largely reduced and thus cause an increased flow of petrol, is, on the other hand, slightly increased. This action is positive, and is dependent entirely on the speed of the air entering the carburetter, and so automatically

keeps the mixture correct from the lowest to the highest speed. (It is to be understood that the change of speed to which we refer here is caused by a change of gradient or some other outside force, and not by a movement of the throttle.)

The second difficulty—that of maintaining a sufficient head of petrol with the throttle almost closed—is met by fitting a small slow-running tube from a point opposite the jet to the small opening of the throttle. The result is that at small openings the suction is concentrated almost entirely upon the jet, and, as the throttle is opened further, the special concentration upon the jet is lessened in proportion to the throttle opening, and there can be no “dead” point or change from one operation to another.

### Other Details.

The size of the jet is controlled by a taper needle which is designed to be used as an adjustment to suit varying atmospheric conditions, also a rich mixture can be obtained for starting purposes, after which the needle can be returned to its normal position. This control needle passes through the centre of the slow-running tube and greatly facilitates starting from cold by increasing the capillary attraction of the tube and enabling it to hold the petrol which is squirted into it when the carburetter is flooded. Only very slight flooding is necessary, as the petrol which is held in the tube readily forms an explosive mixture by mingling with the air contained in the induction pipe. The jet control also produces an annular jet, with its obvious advantages and freedom from choking.

As the rich mixture issuing from the small end of the inner choke tube impinges upon the air passing more slowly around it, a very thorough mixture of petrol and air is the result. The carburetter has no constantly moving parts, and obtains perfect correction without the use of a number of small jets, and is without a multiplicity of adjustments which can easily be upset. The only adjustment can be controlled from the saddle. Another advantage is that the mixing chamber is capable of being turned through an angle of 90° about the float chamber, and so it can be used as a vertical or horizontal carburetter at will; in either case the jet will be at an angle of 45°.

It will be gathered from this description that the carburetter is a most interesting one, and has great possibilities.

The A.B.C. automatic injector carburetter.

# THE 1917 7-9 h.p. HARLEY-DAVIDSON.

Twin-cylinder Engine (84.1 mm. × 88.9 mm., 938.83 c.c.) having New Cam Design.

(Left) A specimen of the 1917 model 7-9 h.p. Harley-Davidson. (Right) The electrified Harley-Davidson, which is equipped with the Remy electric lighting, warning, and ignition system.

THERE is not outwardly very much difference between the 1917 Harley-Davidson and the 1916 model, except the striking change of colour, the "silent grey fellow" to which we have been so long accustomed having changed his coat for a khaki hue. The colour is most effective, and is adhered to throughout the whole machine, with the exception of the timing gear cover, which is left polished aluminium, even the crank case harmonising with the rest of the machine. A further inspection reveals the fact that the detail finish has been very greatly improved.

## Engine Improvements.

The chief alteration is in the power unit, and consists in the adoption of a special cam wheel, possessing four cams, each one of which is different. It will be seen that the cams are arranged in pairs, and actuate the four rockers inside the timing gear case. The reason why the cams are all different is not at first apparent to the casual observer, but a further study of the arrangement will show that the difference in contour has been arranged to make up for the idiosyncrasies of each cylinder. The matter has been carefully studied, and each

cylinder now develops an equal amount of power, and so much has the running of the engine been improved that 16 h.p. has been guaranteed. The small pinion on the engine-shaft, besides driving the cam wheel, drives also the timed crank case release valve, which is an excellent Harley-Davidson feature of long standing. It allows the crank case compression to escape on the downward stroke of the pistons, and prevents oil from being driven out from the bearings. A still further improvement has been made in the valve gear; the lower portions of the push rods operating the inlet rockers are now enclosed by casings containing springs, which cause the rollers to follow the cams at all speeds, and reduce rocker arm clatter to a minimum. The inlet valve stem now works in a longer guide so as to reduce wear, while the width of the inlet valve seating has been reduced so as to ensure longer and better seating without regrinding. There are more coils on both inlet and exhaust valve springs, in order to ensure uniform tension. The coils are wound by an improved method, which prevents distortion and gives the springs a longer life. The inlet domes are ventilated so as to provide adequate radiation, and cause the springs to retain their temper through being kept reasonably cool.

The main engine-shaft on the driving side is now provided with a bearing of

the double roller type, which replaces the ball bearing used on the 1916 model. The shaft itself forms the inner race of the bearing, thus simplifying construction and reducing the friction. An oil channel leads into the bearing direct from the crank case, and after the lubricant has run through the bearing it is deflected by a deflector ring through a second channel at the bottom, thence returning to the crank case, while the deflector acts as an additional oil guard to the felt washer, which has been a standard fitting on Harley-Davidson sprocket shafts during the past two seasons. The outside of the flywheel is now provided with a hardened steel facing ring to take side thrust, which is used in connection with the roller bearing just referred to.

The newly-designed double cam wheel.

## Induction Pipe and Carburetter.

Some alteration has been made in the design of the inlet pipe and also in the method of attaching the carburetter. This inlet pipe is of smooth and even design, and is so shaped that the mixture

Three-point adjustment of the automatic air valve.

The new inlet pipe and carburetter attachment.

**The 1917 6-7 h.p. Harley-Davidson.—**

can flow with equal ease into each cylinder. The carburetter is now bolted up against a casting forming a flat face. In the carburetter itself there have been

The latest H.-D. has a detachable rear guard.

some slight alterations, the most important of these being a three-point air adjustment, which enables the driver to alter the position of the automatic air valve so as to suit different temperatures. A new needle valve actuating cam is now fitted to the carburetter, and when the latter has once been correctly adjusted it is unnecessary for the rider to make any further alteration. However, if an increase of power is desired, use may be made of the large auxiliary air shutter at the side.

A small detail which will be much appreciated by those who look after their own machines is in the fitting of the oil pump, which may now be reached by the employment of an ordinary screwdriver, whereas formerly to dismount the pump special tools were required.

**General Improvements.**

A few improvements in detail have been carried out in the Remy electric lighting, warning, and ignition system, which provides a high-tension alternating current for the ignition, a low-tension direct current for the horn and lamps, and also serves to charge the battery. It is not generally known that in the event of the battery being run down a start can be made by using the generator direct, the generator then acting as a magneto, but it is required in this case to put a little more energy into the kick-starter. As soon as the engine starts running the generator begins to charge the battery

which gradually resumes its normal condition.

The main features of the machine have not undergone any great alteration. For example, the gear box is the same, but the kick starter has been improved by providing a rubber-covered pedal, which gives more surface for the foot to work upon than the step which was provided in last year's model. Strength has been added to the back stand by providing a substantial web at the ends. Last year the front chain cover was incomplete, but now it encloses the whole length of the chain.

To enable the rider to have access to as large a portion of the tyre as possible, the rear end of the back mudguard is detachable. Attached to this is the tail lamp, the wire of which passes through a brass tube underneath the mudguard, and is thus adequately protected from the elements.

Of the two brakes in the rear hub, the external band brake is controlled by hand. This has been improved in design, and is provided with powerful take-off springs, so that the brake frees itself when the pressure of the hand is released. The size of the drum upon which the brake acts is 7½ in. in diameter with a ½ in. face. The foot brake is of the internal expanding pattern.

Attention has been given to the relative positions of the handle-bars, saddle, and footboards, with the result that the riding position has been considerably improved, and the comfort of the 1917 Harley-Davidson has been consequently increased. Altogether, the latest model deserves the highest praise. The reason given for the change in colour is that it is chosen by the American military authorities, who have taken delivery of a large number of these machines for military work during the year.

The latest Harley-Davidson power unit with cover removed, showing new cams and timing gear. The new pedal starter will be observed.

**MOTOR CYCLES IN THE WAR ZONE.**

AS stated in last week's issue, Mr. Richard Moore, director of Messrs. Phelon and Moore, Ltd., recently visited the various R.F.C. stations in France where repairs, etc., are being carried out. Accompanied by Capt. Jarrott, M.T.R.F.C., Mr. Moore landed at Boulogne, and first visited the 1st A.D., which he found to be well equipped and ably managed.

Moving to the second A.D., Mr. Moore found himself well within earshot of the guns, which, at that distance, was a continuous boom, the only comment at the station being that "some poor blighters were getting it"! Mr. Moore was able to give those in control of the repairs department several useful tips, which were much appreciated, and he and Capt.

Jarrott then moved to the G.H.Q., where their report was made.

**A City amidst the Firing Line.**

Mr. Moore expressed a desire to visit a squadron operating under fire, and subsequently he was taken by car to a city in the midst of the firing line. Here he describes the road conditions as beyond all belief. It was impossible to sit naturally on the seats of the luxurious car provided, and throughout the journey they were compelled to support themselves by clutching the seat with both arms rigid. They were driven at walking pace, but even then their heads occasionally bumped the canopy. The D.R.'s, however, seemed perfectly at home, riding at surprising speeds over the skiddy and

shattered roads. The batches of German prisoners, working on the roads, also seemed quite contented.

At all quarters Mr. Moore heard nothing but praise for the P. and M. machines.

Only one unpleasant experience befell them, when amidst rain and darkness, Mr. Moore and his colleague had some difficulty in locating the ancient chateau where they were to put up for the night; but, finding it eventually, they were greeted by a most effusive and willing host, whose quaint manners afforded them much amusement.

Mr. Moore anticipates a periodical visit to France—an arrangement which would doubtless prove of very great assistance to the willing and able officers in charge of the P. and M. motor cycles.

¶ The tourist or racer of yesterday is the despatch rider of to-day. He is naturally a connoisseur of the things that make motor cycling successful — and he welcomes such trusty equipment as Avon Tyres with lively recollection of “services rendered” in the good old days before the War. Sometimes he is good enough to write us — as, for example, the following from an A.S.C. driver at Zagazig, Egypt :—

¶ “Before proceeding to Ismailia I was stationed at Alexandria, and for two months I rode a ‘Douglas’ motor cycle fitted with Avon tyres. The roads were of the roughest — cobbles, sand, etc. — but, despite the hardest wear and tear, I experienced no trouble whatever with the tyres.

¶ “My work was delivering despatches, and the machine was very seldom at rest. No matter what part of Egypt I have been to, I have always found the greatest reliance is placed on Avon tyres.”

## MILITARY NOTES.

## PENALTY FOR BEING TALL!

A CADET writing to us last week bewails the fact that he stands no chance of being accepted for the Tanks, as he has been informed that only small men are wanted, and he himself stands over six feet.

## HON. SEC. OF THE M.C.C. CONVALESCENT.

SERGEANT W. E. SOUTHCOMB MAY, late hon. secretary of the Motor Cycling Club, when we last heard from him was with the Motor Machine Gun Section in German East Africa. He now writes from Alexandra Hospital, Maitland, Cape Town, where he is convalescent:

"The above address is the result of getting in the way of a bullet on September 12th. but I am hoping to get back to my regiment very shortly. I had a varied journey back from the Front to Korogove, the stationary hospital—motor lorry first, then seven miles on a stretcher, and the rest of the way by Ford ambulances.

"The roads are appalling. We got hung up at Turiani for eight days owing to rain, and as the hospital there was moving, they had sent most of their stores on, and we were on half rations. By the time we eventually got to Korogove the wounds in my leg were healed, but as I had been hit by a ricochet, and I was

Sgt. Southcomb May, M.M.G.S., late hon. sec. of the M.C.C.

sure there were some pieces still in, they X-rayed me and operated forthwith, making four cuts: so I had to start the healing process all over again. We came down here by the hospital ship *Ebani* from Tanga after a fifty-mile trip in the hospital train. The railroad was about on a par with the rest of the roads. I have never before been so thrown about in a train.

"I had three days' scrapping up in the mountains, and got through nearly 3,000 rounds with my Vickers gun. That was on September 4th. We had marched over 200 miles, and had quite despaired of ever seeing a shot fired. My company went into action again on the 12th, after which I left, leaving only one of the six who went out from Bisley in the firing line—fever, etc., having caused the temporary absence of the others.

"I have seen three issues of *The Motor Cycle* since I have been out; they came from the Armoured Car Section, and one of them I had seen at home—in fact, it was the one with my portrait in."

## THE LATE SEC.-LT. O. C. GODFREY.

IT has been previously announced in these pages that Sec.-Lt. O. C. Godfrey, R.F.C., was reported missing. At the time it was hoped that he had been forced down in the enemy lines and taken prisoner, but later practically all hope was given up of his being alive, and on the 13th inst. he was reported by the War Office as killed. We have known Godfrey for a number of years, and are keenly aware that his loss will be a serious one for the motor cycle community. He was an excellent sportsman in every sense of the word, and a first-class rider of no mean skill.

Early in the war he offered his services to his country, and applied himself most diligently to his work with the Flying Corps. He eventually passed the tests and duly became a second-lieutenant and a pilot in the R.F.C. Not very long after, however, he suffered an accident and broke his leg, and while on leave recovering from this he officiated at a motor cycle meeting, acting as starter, on the occasion of the H.Q.C.D. hill-climb at Pebble Hill, Dorking, on July 29th, 1916.

Godfrey's name first appeared in the issue of *The Motor Cycle* of February 19th, 1906, when he rode a 4 h.p. twin-cylinder Werner, in the hill-climb organised by the Lewisham Automobile Club, winning his class. He rode consistently throughout the year, and became quite famous on his bright yellow Werner. During the same year he rode in the first Land's End to John-o'-Groat's run, but after performing well for the greater part of the journey had to retire with a broken connecting rod at Pitlochry. When the Werner disappeared from the public gaze, he rode Rex machines, and as usual performed well on them. Riding a 3½ h.p. Rex, he set up one of the first 500 c.c.

The late Sec.-Lt. Oliver C. Godfrey, R.F.C., killed whilst flying over the enemy lines.

hour records at Brooklands, which remained unbroken for several years. Later he became a devotee of the Indian, a machine to which he adhered until the outbreak of war.

It is interesting to note that at the end of our report of the Lewisham A.C. hill-climb just referred to the following paragraph appeared: "H. Mogridge entered a 2 h.p. chain-driven Indian, a much boomed American motor cycle.

Godfrey founded the firm of Godfreys, Ltd., that prosperous business in Great Portland Street, which acts as the retail London agents for the Hendee Manufacturing Co., and does an extensive business in second-hand machines.

To revert to Godfrey's prowess, it may be mentioned, among his numerous performances on road and track, that in 1911 he won, after a magnificent race, the Senior Tourist Trophy on a twin Indian, and on the occasion of the last Senior T.T. race in 1914 he tied for second place with H. R. Davies, who was riding a Sunbeam.

Godfrey, who was of a bright and genial disposition, will be sadly missed when competitions are run off once more. We desire to take this opportunity of expressing our sincere sympathy with his widow and parents.

## MOTOR CYCLIST TO LEARN FLYING.

NO doubt many readers will be interested to hear that A. Milner, the well-known Levis competition rider, has now left the Royal Engineers, in which he has been sergeant in charge of a workshop at a D.R. training centre for a very long period. He has applied for a commission as pilot in the R.F.C., and is now training in an O.T.C. We expect the D.R.'s at the training centre will miss his amusing and thrilling trick riding, in which he was a real expert.

O. C. Godfrey was undoubtedly the finest exponent of the Indian machine in Great Britain. He won the T.T. race in 1911 and finished second in 1914.

### Motor Cycles taken by Train.

For the period of one week dating from last Monday, Railway Companies will not carry by passenger trains motor cycles unaccompanied by passengers.

### Motor Cyclist Volunteers Wanted.

The Warwickshire Volunteer Regiment are appealing to motor cyclists to join the Motor Section, which is in urgent need of recruits. Every man who joins the Volunteers releases one man for service abroad. Applications should be addressed to Adjutant, Warwickshire Volunteer Regiment, Motor Section, Orderly Office, 142a, Great Charles Street, Birmingham.

### Christmas Number of "The Light Car."

In the Christmas number of *The Light Car* there are several features of special interest, among them being an entertaining article entitled "Legends of the Road," a racy narrative dealing with some traditional spectres of the highway. "Unlucky Houses" deals with a subject especially interesting at this time of the year. "A Motorist's Christmas Dinner" and "Consolation from Retrospection" are among other entertaining articles in the issue.

### An Admiral's Widow Honoured.

Lady Arbuthnot, widow of the late Rear-Admiral Sir Robert Keith Arbuthnot, received from H.M. The King, at Buckingham Palace on the 13th inst., the insignia of a Knight Commander of the Bath, awarded to her late husband, who went down in H.M.S. *Defence* in the Battle of Jutland.

Lady Arbuthnot has recently taken a very keen interest in the Arbuthnot Trophy, and made very valuable suggestions to Lady Scott who is executing it. The statuette will be completed very shortly.

### A Rude Awakening.

At Shoreditch Tribunal.  
Capt. Fisher: "Who called you up?"  
Applicant: "I have an alarm clock."  
The Mayor: "It will be a bugle in future."

### Colmore Depot's Greeting.

We have received an amusing greeting card from the Colmore Depot, Birmingham, representing in a humorous manner the advance of a Tank across the German lines. The Colmore Depot will be pleased to send one to any person who forwards his address. Accompanying the card was a Roll of Honour giving the names of fifty-five men of the staff who had responded to the country's call.

### See "Exchange" Column.

It is interesting to know that if any of our readers have "anything motorish" lying about their garages that is in the way generally they may obtain two drum tambourines and a new accordion in exchange for these goods. A solid oak music stand, pianola, roll top desk, typewriter, and 7in. lathe are among the items offered in exchange for motor cycles this week.

### A Double Deck Sidecar.

A manufacturer in Eastern U.S. has constructed a double deck type of sidecar stretcher, which it is proposed to use as a high speed motor cycle ambulance. The track of the machine is adjustable to suit different road conditions, and straps over the chest and feet are used to hold the wounded men in position while being transported.

### The Triumph Co.'s Example.

At the annual meeting of the Triumph Co. last week Mr. S. Bettmann, seconding the chairman's (Lord Leigh's) proposition, said, in reviewing the situation of the company, that 560 employees had enlisted, and that 60 or 70 of them had been wounded. Those who were able to work would be taken back by the Triumph Co., and if the directors had to sacrifice their salaries and their fees those men would not be allowed to be deficient in anything that was necessary to uphold them and to enable them to

## SPECIAL FEATURES

SEASONABLE ARTICLES AND  
ILLUSTRATIONS.

NEW DESIGNS (Illustrated).

live in relative comfort. Out of the number he mentioned about 25 had been killed. He was particularly proud that they had a Pension Fund, out of which he hoped, in addition to the Government grant, they would be able to support the widows and children of those brave men.

### Dangers of Ruddy Ice.

During a recent week-end a member of the staff, a well-known rider, had a narrow escape from a disaster which might have ended disastrously. After almost accomplishing a trip of about 100 miles in the night, and thinking the terrible journey would soon be over, he struck a patch of ruddy ice which caused the machine to skid. He rolled over several times and eventually landed on a heap of granite with the machine on the top of him. After he recovered sufficiently to grasp the situation he found pure petrol running freely over his coat and face, and the lamp with the door open still burning within an inch or two of his saturated garments. What might have happened did not happen; there is no dramatic sequel, only a moral.

### Spring Frame Criticism—Ten Years Ago.

"Ixon" writing ten years ago—in the December 5th, 1906, issue—criticised the spring frames of motor cycles exhibited at the Stanley Show. "There is a perfect rage for spring frames. Several firms exhibited sound devices of this kind, though I saw one or two machines with springs of so great a play, that I am certain the tail of the front guard (and perhaps the bottom of the crank case as well) is bound to touch stones occasionally, if not the road surface as well. I was a little surprised at this tendency—I should fancy the vertical bouncing of the entire weight on the road wheels must tend to induce slip, and on paper I prefer a device like the Bat, which insulates the rider, but leaves the weight of the machine steady on the rear wheels."

It's a muddy road and a bloody road,  
And a road that's swept by fire,  
But we've got to get through with the Orders 'bus  
Or we'll raise the C.O.'s ire.

So you'll hold at the bend, I know, old girl,  
You'll stick it and turn not a hair,  
Just one more dash! Through one more splash!  
And we're there, old girl, we're there!

The Dunlop rubber-studded non-skid motor-cycle cover.

# SUNBEAM SUPERIORITY

23rd October, 1916.

The Palace Cigar Box,  
Reading.

Dear Sirs,

Including my two Sunbeams ( $3\frac{1}{2}$  h.p.) I have had 17 motors in 5 years for my own private use; the 1915 model I bought of Messrs. Baker and Son, Reading, in May last year, and, after travelling 25,000 miles in **all** weathers regularly, it has not yet cost me a penny for repairs, and I have not had a single trouble on the road; in fact, apart from puncture trouble, I could have ridden the whole distance without tools, and now the machine looks better than any other make I have had after doing 10,000 miles.

My 1916  $3\frac{1}{2}$  h.p. I purchased through an advert. in "The Motor Cycle" a fortnight ago; the machine has only done 1,500 miles, and is unscratched; the price I gave for it was £65; two friends of mine here want it, their offers are £70 and 70 gns., but it is not for sale; they are keen on it, knowing all about my 1915 model.

Yours faithfully,

W. PRIDMORE HARDY.

Prospective buyers are advised to apply to have their names put on our Waiting List.

Catalogue and full particulars sent on application to

**JOHN MARSTON, LIMITED, 11, Sunbeamland, WOLVERHAMPTON.**

## FEATURES OF THE **JAP** ENGINES

### No. 5.—THE INLET PIPE.

It will be remembered that the usual practice in fitting an inlet pipe to a twin engine is a very tedious and awkward one. The J.A.P. pipe has been carefully designed to overcome all these troubles, and, at the same time, give a perfectly gas-tight joint.

The pipe is a very light casting, all three "limbs" are turned, inside and out. The brass ferrule "A" is a sliding fit on the pipe, and the top portion of the nut "B" is bored taper to exactly correspond with the ferrule. In fitting, the nut is first slipped on to the pipe, then the cone; hold pipe in place and put cones tight up against inlet ports and screw up nut. The result is that the thin edge of the cone grips the pipe tightly, that air is entirely excluded, and a perfect fit is made. It also allows for any expansion in the cylinders. A further advantage is that the pipe is adjustable; should the pipe be transferred to another engine, or for any reason another cylinder fitted, the same inlet pipe will serve.

B10

When examining the various features of the J.A.P. Engine, their careful design and sturdy nature give the user confidence of reliability. Every part is a sound engineering job, all flimsy work being studiously avoided, therefore

Specify always J.A.P.

**J. A. PRESTWICH & CO.,**

Northumberland Park, Tottenham, London, N.

Grams: "Prestwich, Tottilane, London,"  
Phone: 1613 Tottenham.

*In answering these advertisements it is desirable to mention "The Motor Cycle."*

**Easy Starting from Cold.**

If any reader has trouble in starting his engine these cold mornings, half a kettleful of boiling water poured over the inlet pipe will work wonders. Water is cheaper than petrol these days.

**Silencers or Mufflers.**

When the American makers build factories in England shall we have to call a silencer a "muffler"?

In many instances the latter term will be more correct.

**Alldays and Onions' Report.**

The directors of the above company, although unable to present a balance-sheet, are satisfied that the profits made justify the payment of a further interim dividend on the old ordinary shares of 7½% for the six months ended July 31st, 1916, and a bonus of 2½%, making, with the interim dividend already paid, 12½% for the year.

**Petrol Licences in Ireland.**

Up to the present time the usual Petrol Control Committee licences have not been necessary for the purchase of petrol in Ireland. A recent Army Council Order under the Defence of the Realm Regulations now prohibits the sale of petrol there, except to the holders of special licences issued and signed by the competent military authority, authorising the purchase of a specified quantity of spirit.

**Sidecarists Wanted in France.**

The British Ambulance Committee to the Service de Santé Militaire requires immediately the services of a few expert sidecarists who can speak French. Men of military age are eligible provided they have not been passed for general service. Paid men are provided with uniform, keep, and £2 per week; volunteers are kept and only have to provide their uniforms. Applicants should write to the British Ambulance Committee, 23a, Bruton Street, London, W.

**Valve Lifter on the Zeppels.**

One would hardly credit the Zeppelin engines with a valve lifter; nevertheless, they have one. It lifts all the valves for starting, and the exhaust passages are then closed. Gas is subsequently pumped into the engine, and the valves are allowed to fall. The next operation is to produce sparks in the cylinders, which are already filled with gas; this is done by a geared up magneto revolved by hand. Result, "phut, phut," many "phuts."

**Another Old Motor Cycle Feature.**

Cast threads and steel cylinders, another feature of the Maybach engine, were quite common on Zedel racing motor cycle engines some years ago. Anzani, Demeester, and other Frenchmen rode machines fitted with such cylinders, and they had overhead valves, too.

The only difference between the Zepp engine cylinders and the Zedel was that the heads of the latter were hard cast iron and not malleable.

We suppose the experts have not been deceived with regard to the Maybach heads. Did they commence life as hard iron and become annealed in the air and on the ground?

Perhaps not. It takes a fortnight in an oven to make good malleable.

**American Motor Cycle Journals.**

There appears to be nothing in the U.S.A. in the journalistic line which occupies the same position as *The Motor Cycle* does in England. The two principal motor cycle papers seem to ignore the private owner, and to devote their energy to fostering the trade, and the trade only, while, curiously enough, they are both introducing pedal cycles into their pages.

**Fickle December Weather.**

At this time of year many varying weather conditions are likely to be encountered on a cross-country ride. During a recent hundred mile early morning ride we encountered the following conditions: Start in mild, clear weather, then came mist, mist and frost, fog and snow-covered roads, mild and rain, cold mist, then ice-covered roads (very treacherous), sleet, snow-covered roads and thick mist again, finishing in dense yellow fog with mild atmosphere; two hours later a heavy snowstorm took place.

**Special Features of this Issue.**

It is our usual custom in the Christmas issue of *The Motor Cycle* to include features of a seasonable nature, but as we are in the midst of a world conflict, and most of us are either directly concerned or have associates who are engaged in warfare, we have included articles that have "war" atmosphere, and departed from our usual type of Christmas motor stories.

**Petrol Figures.**

We imported into this country last year (1915) 150,000,000 gallons of petrol. A vast quantity indeed, but relatively small when compared with the consumption in the United States. Nearly 1,000,000,000 gallons are used annually, yet the population of the U.S.A. is only double that of Great Britain. If the industrial and all other petrol consuming devices are reckoned, then 2,400,000,000 gallons will be about the amount of petrol consumed in the United States in twelve months—truly an enormous quantity, but likely to be still further increased during next year.

FROM THE CAUCASUS TO THE DOBRUDJA.

The difficulties of transit on the narrow rocky mountainous roads of the Caucasus are revealed in the photograph, which shows part of the British armoured car section, consisting of Lanchester cars of the Royal Naval Air Service, halting whilst a Red Cross ambulance car passes by. A despatch rider's mount (a Douglas) is seen in the foreground.

# Some M TOURIST TROPHY I

Being the fo  
reminiscen  
mence

**I**T is curious how the Isle of Man always crops up sooner or later when a few D.R.'s foregather. The sporting little place certainly gets a hold on one's affections; even though we all vote the T.T. as dull as ditch-water when we board the home-bound steamer, and we all know perfectly well that as soon as the war is over we shall all be there again, simmering with the same frantic excitement. Indeed, we often find ourselves smiling at the want of proportion which turns our sympathies more to the distress the war has brought on the kindly Manx folk than to the infinitely more pitiable fate of Belgium or Armenia. I wonder if the Manx girls are to blame for the spell their home has for so many motor cyclists. I always think it is a toss up whether an Irish or a Manx belle is the prettier; certainly, there is nobody like her anywhere else. That dark red hair, freckles—more bewitching than a sedan chair beauty's patches have ev-

**Some Manx Memories.—**

had given him a dose of a patent drug which paralyses your stomach and prevents it from flapping when the stormy winds do blow at sea. But his Good Samaritan never told him that the stomach should be empty before you paralyse it. So he made an unusually hearty meal, intended to last the voyage, and then he duly paralysed his interior. I spare you all the details of the menu, but we were not out of the Mersey before he confessed that a five-course breakfast, when paralysed within you, feels rotten. Halfway over he decided he would rather be very seasick indeed than put up with that paralysed breakfast any longer. So he was.

Some readers will recall the most lurid voyage of many which we have shared. The sea at Douglas is usually rough, but on this occasion spume flying over the Promenade warned us what things would be like off the Head. After its custom of speeding the parting guest, the I.O.M.S.P. Co. had put on its oldest and narrowest boat—a champion “roller.” There were something like 400 motor cycles on board, and fifty cars, whilst the passengers were packed as tightly as oysters in a barrel. Many people capitulated to Neptune before we cleared the breakwater, and the agonised faces of those riders on the lower deck who saw green faces vertically overhanging them from the upper deck will ever live in my memory. I fancy that more than once on this voyage it was touch and go whether the old boat would ever recover from one or two of her worst rolls, as the tons of metal on her upper deck made her more top-heavy than ever.

**The Onlooker's Point of View.**

The racing? Well, I hope I am not *blasé*, but as a spectacle it is somewhat overrated. The eye soon gets habituated to high speeds, and after two or three laps there does not seem to be anything very wonderful about the pace. If you have the patience to keep in touch with the positions of the riders, you begin to form opinions about the results, and anyhow you

are gradually learning whether any new engines or riders show extraordinary capabilities. This is, perhaps, the main interest of the opening rounds, unless you chance to be a frenzied partisan and would bet your boots on one given make. The closing laps are always breathless. You know, and the riders know, that the issue lies between a select knot of riders, and perhaps only seconds separate them. One of them is sure to be your favourite, and probably some of the leaders are on foreign-made machines.

But, taking the whole race through, the chief interest lies in watching the magnificent corner work of the few brilliant riders who are out for blood; some of our cracks, as you know, ride for safety, and depend on the other fellows' mistakes. Let me sit somewhere within earshot of a telephone, and close to a bad corner, where I can see the Scotts lying over till their radiators almost tear the ground, and I ask for nothing better.

**Other Attractions.**

There are other attractions, and it is the sum total of a Manx week which tempts us all over the water. There is the incomparably ridiculous golf on Douglas Head. Scores of duffers intermingled with scratch men, nearly all hopelessly out of temper with each other, or with the jeering townies ensconced in the gorge out of bounds; and the chance of a sea fog descending and swamping you all in a mist from which hoarse cries of “Fore” and whizzing balls emerge in all directions. The Palace, where you may see 3,000 couples on the floor at once, and perchance be lucky enough to see a girl in evening dress footing it with a partner in a straw hat, tail coat, and gaiters. The music halls, where you may get London programmes, with topical petrol verses and patter thrown in. The grease—than which none in the world can be more skiddy! The fog on Snaefell at early morning practice, out of which low crouching figures hurtle at 70 m.p.h. There's a lot of human nature in a Manx week. May we all keep another one together, when the Kaiser has gone to his own place.

## THE ART OF ADVERTISING.

### YEAR OF ORIGIN AND PRICE THE MOST NECESSARY DETAILS.

**W**HEN a prospective motor cyclist has decided to purchase a motor cycle second-hand, he will most likely consult the second-hand advertisement columns of a motor cycle journal, having in all probability previously decided on the type of machine required, and in most cases also on the particular year of manufacture, most suited to his banking account. Now, curiously enough, this most essential particular is often omitted by the advertiser, who seems to think that the prospective buyer will be misled into believing that the machine in question is of more recent date. The price, too, is often omitted, with the result that the advertisement is passed over with only a casual glance. The following details are really essential in order to sell to the best advantage:

First and foremost, the date of manufacture, then horse-power, type (whether T.T. or touring), the number of gears, and whether a kick-starter is fitted. Another useful piece of information is the approximate number of miles covered, while the price

expected is most necessary, as many purchasers will not take the trouble to write or go to see a machine when they have no idea whether the price that will be asked will come within their means. Any accessories which are included should be mentioned, and, if the machine is a sidecar outfit, the make and type of the sidecar are also necessary. The writer would suggest the following as a typical advertisement, and one which is likely to succeed in its object:

“1916, —, 7 h.p., three speeds, kick-starter, chain drive, 26 x 3 — tyres unpunctured, machine covered 4,000 miles, enamel and plate unscratched, mechanical condition good, expert examination, — lamp set, — speedometer, tools and spares, — sidecar, torpedo coachbuilt body; £70.—Address.”

With such an advertisement the prospective purchaser knows roughly what he is to expect, and if these essential details come up to his requirements all he has to do is to see the machine to confirm the specification.

# Safety and Speed go with Bates Tyres

They not only mean economy in petrol, but they stand the toughest of tests, and the increased output due to growing popularity has made it possible, in spite of higher cost of materials, to reduce prices.

*Lose no time in writing for our new illustrated price list.*

Note this testimony of a Government official in Australia :

"After a varied experience of eight different makes during the past nine years I was forced to the conclusion that no tyres were much good. But I am so delighted with my first experience of Bates Tyres that in future I will see that my machines are always equipped with your excellent tyres."

## LETTERS TO THE EDITOR

The Editor does not hold himself responsible for the opinions of his correspondents. All letters should be addressed to the Editor, "The Motor Cycle," Hertford Street, Coventry, and should be accompanied by the writer's name and address.

### A Curious Case.

Sir,—I possess a  $2\frac{1}{4}$  h.p. Levis, 1916 model, and I have been troubled continually for the last two months with the carburetter. The machine runs perfectly when started from cold until hot (for about two miles); then, when it is necessary to open out for hills or more speed, there is a peculiar choking and blowing back in the carburetter, also in the silencer, and, I am inclined to think, through the release valve as well. The fact is the machine will take only a set proportion of the throttle, and if this is exceeded the engine chokes up completely and soon stops.

I may say, I never so much as heard the engine "pop" before the time stated, and I have tried the engine with all mixtures of spirits and still with no better results. I have tried enormous sizes in jets, and am running on a 26 now, which was fitted when new. The petrol flows quite freely to the carburetter, and it has been cleaned times without number to make sure that dirt is not the fault. There is no hole in the induction where air can leak.

Probably some of your readers have had the same experience with their machines, and I shall be glad of their advice. (CYCLIST) H. J. IVES (2581).

### An American Rear Car.

Sir,—In reference to *The Motor Cycle* of November 2nd, 1916, we wish to correct the statement of your correspondent, Mr. T. W. Cooper, Toronto, Canada, that the driver is still exposed to the elements, as you will see by the enclosed illustration showing the protection afforded the motor cycle attached to Cygnet delivery car and Cygnet pleasure car.

In the near future we expect to have a test made by a leading engineering school, showing the relative superiority of the Cygnet rear car over sidecars, and substantiating the claims which motor cycle drivers have made to us as follows: (1.) Larger capacity. (2.) Less wear and tear on the motor cycle. (3.) Less petrol. (4.) Less danger of accident. (5.) Easier operation for motor cycle rider. When these tests are completed we will send you copies.

CYGNET REAR CAR CO.  
Buffalo, U.S.A.

The new American Cygnet car hood, which completely protects both driver and passenger. (See letter.)

### Will the Single-cylinder Survive?

Sir,—Replying to the article by "Road Rider," I consider myself in a position to intervene, because I have ridden for 11,000 miles one of the machines which he instances as being comparatively free from engine vibration. This was a 1913 four-cylinder F.N., from which I had great satisfaction except as a sidecar machine.

I passed straight from this machine to a 1915 650 c.c. single made by Bayliss, Thomas, and Co., and have in no way regretted the change. I find that I am less tired after riding a long journey on this machine than after a similar journey on the four-cylinder. Perhaps the explanation is that the Excelsior machine (English) is so well provided with a slipping sprocket that the drive is really not rigid at all, despite the all-chain drive.

Tyre wear and petrol consumption are better than on the F.N. As for power, I dare not compare the two, because I would not be hard on a good machine, which was essentially reliable, but was very mistakenly (as I think) considered as a sidecar machine.

I have ridden all three of the most popular singles which were the other day referred to as the worst. I agree with the verdict, and I write this letter because I would not see the English Excelsior classed with them. Usual disclaimer applies.

A. G. CHILD.

Sir,—May I be allowed to say a few more words on this subject? I have read Mr. M. A. Pyke's letter with special interest, as my experience in the matter of petrol consumption by "singles" has been very similar to his, and, although 120 to 140 m.p.g. may have appeared an exaggeration to some of your readers, I am fully convinced that it is not so in the case of a well-tuned and well-driven  $3\frac{1}{2}$  h.p. single. On three consecutive Sunday mornings in the early autumn of last year I ran to Brighton and back, a distance of 110 miles from my residence, on a T.T. Rudge-Multi. The riding conditions on the three occasions were practically similar, and each journey of 110 miles was done on seven pints of Shell No. 1. Had my average speed been somewhat less (the riding times for the journeys averaging 3h. 40m.), the consumption would have reached the high average mentioned. My average consumption with a 4 h.p. countershaft Triumph, over a mileage of 7,600 and with a top gear of only 5 to 1, has been slightly over 100 m.p.g. I should like to know of any horizontal or V type of twin of similar capacity that can show such economy. Also, I should like to know how the driving powers of such engines would compare with those of singles, equally geared, across, say, Salisbury Plain,

against a westerly wind blowing at a velocity of 60 m.p.h., as it often does, or across Lincolnshire in the teeth of a cold easterly wind of like velocity, in which carburetters are prone to freeze. I venture to think the twin would, comparatively speaking, put up a poor performance. In conclusion, again I ask, can the survival of the single be denied after the War Office has given it the place of honour it has had in the Army? MYER B. LEE.

Sir,—Might I trespass on your valuable space to inflict my dole in defence of the big single? It would seem that the largest stone thrown at it is that it cannot be considered so mechanically perfect as the flat twin. But what is mechanical perfection if it is not maximum efficiency, and what is superior efficiency if it is not a lower fuel consumption, a greater pulling power, and greater reliability; and who will deny the big single these qualifications? In fact, I consider the big single at present preferable to the flat twin on almost every score. I say "at present," because the flat twin is as yet in its infancy, and will doubtless undergo many radical changes for the better before it settles down into the groove of almost standard design which characterises the best known big singles. The assumption that the flat twin is so much more flexible than its one-lunged rival is surely not well founded. If the "horizontally-opposed double motor" is really so flexible, why is a fixed geared specimen practically unheard of, while the T.T. fixed engined, single-geared single abounds?

I have had experience of both types of machines of the most popular makes, and I can confidently state that my experiences, at any rate, justify my preference. My present mount is a Triumph, and if I can wait till the cessation of hostilities again liberates the supply of these excellent motor cycles, my next love will be a Triumph also.

MALCOLM G. HALLOWES.

#### The Double-acting Two-stroke.

Sir,—May I be allowed to criticise the three designs for one-stroke engines as applied to motor cycle engines? In the first place, all designs are quite possible for large power water-cooled engines, but for motor cycles, in my opinion, unworkable, for these reasons: Commercial expense to produce, gland troubles, inaccessibility of slides and valves, overheating of pistons and rod and stuffing boxes. It will be noted that two designs require a working cylinder and a pump cylinder, and employ two cranks, etc., and would require three bearings. When the total is set against two simple cylinders with a double crank in one case with two bearings and utilising lower portion of each cylinder for pump cylinder with cool gland, it can be seen the latter is the simpler and cheaper to produce. H. SWIFT.

#### Petrol Substitutes.

Sir,—I herewith send you particulars of my experience of running on petrol substitute for the last six months, having just taken my engine down for cleaning, etc.

My machine is a 4 b.p. B.S.A., three-speed countershaft gear, 1915 model, all-chain drive, with sidecar, and it has been run entirely since the end of April on raw substitute without any petrol whatever in the tank. I do not use even an auxiliary tank to start with, but simply inject into the cylinder one teaspoonful of No. 2 petrol, when the engine always starts off at the first or second kick. To each gallon of substitute I add three naphthalene balls, which can be obtained locally anywhere at a cost of about a humble copper (I have tried Spots and other nostrums, but prefer naphthalene balls), with the result that, after running about 5,000 miles, the valves grind in with about five minutes' easy work. The carbon deposit was removed with a duster; even on the exhaust valve cap it was quite loose, and rubbed off with one's finger. I also found all the bearings, gudgeon pin, and the big end perfect, without the slightest shake of any kind. Is not this a record?

As to the carburettor, it is just as it left the makers adjusted for petrol, without any hot-air pipes or other accessories whatever. I have never had the slightest trouble in starting, even in the present cold, damp weather. I am still running the original engine chains. Although the mileage is not large, I have been as far as Farnborough and back several times from here, so it is possible the mileage is more than I have stated.

B18

In conclusion, I may say that I shall never go back to petrol again, and that whilst the machine is at least five miles per hour faster and the consumption about 65 to 70 m.p.g. (it was only 60 m.p.g. with petrol at 2s. 6d.), the only slight disadvantage I can find is that it is not quite as powerful on hills. I can now add the usual disclaimer. B.S.A.

Barton-on-Humber.

#### Two Useful Hints.

Sir,—Having received a vast quantity of valuable information through the columns of your paper, I should like to pass on to others a little in return.

In the first place, the front brake of the motor bicycle is usually little better than an ornament. I obtained a sample of Ferodo brake lining, and cut it to shape to fit the front shoes. The improvement in braking powers is quite incredible. I understand that after the war this firm intends to market its goods for the requirements of bicycles of all sorts. At present after obtaining the lining one has to cut it to shape, but it is well worth while. I have since fitted it as band brake to my P. and M. Result, twice as great efficiency as with my previous lining.

Secondly, who was the idiot that invented the word "tacky," referring to solution? In the event of a puncture two coats of solution should be given, both to patch and tube, and each allowed to get absolutely dry. This is the practice of the repairers in all big rubber firms. I have repeatedly allowed three or four days to elapse between the solutioning and the fixing of the patch. It is years since I had a patch leak. The back tube of my bicycle had patches put on two or three years ago, and there is not the slightest sign of any lifting. I am quite sure that no one will believe (until after trial) the great difference between an absolutely dry patch and one which is "tacky."

Brist 1.

EXPERIMENTALIST.

#### The Flat Twin at the Bar.

Sir,—After reading Mr. de Lissa's letter in *The Motor Cycle* for December 14th I should like to say something on the matter. Firstly, Mr. de Lissa seems to have fallen into the very error of which he accuses Mr. Bradshaw—that of criticising other people's ideas and designs a little too quickly. I think that it is rather obvious that if a "hot top" does occur in the A.B.C. cylinder it is in a far less harmful position than in the overhead valve design, for a "hot side" will tend to warp the cylinder barrel and cause loss of compression, whereas a "hot top" will not have any effect in this direction.

It might be argued that a "hot top" would warp the exhaust valve seating, but this seems to be effectively cooled by the rushing charge of cool gas, as is the plug. I should also imagine that few engines, even the M.A.G., could stand being run "all out" when new, and that most owners are accustomed to run in their engines before driving them really hard. Finally, I do not see that the ordinary A.B.C. engine is so very much a special racing engine as Mr. de Lissa states. Let him grumble if the racing A.B.C.—model C—is sold as a touring mount; but I should have thought that an engine which would stand up to the amount of hard second gear work that the A.B.C. will was eminently suitable for strenuous touring conditions. No one doubts the efficiency of the M.A.G., but it will have all its work cut out to beat the A.B.C. Usual disclaimer. JAM SATIS.

Wellington College.

Sir,—Having read Mr. de Lissa's article on the A.B.C. flat twin I can only draw one conclusion, that he is suffering from extreme jealousy. The usual disclaimer.

A. WILKIN.

#### IMPORTANT NOTICE.

#### GOODS MADE IN GERMANY.

The proprietors of this journal, being fully in accord with the recommendations agreed upon at the Paris Economic Conference, give notice that they will not permit the advertisements of new goods manufactured in enemy countries to appear in this publication, either during or after the war.

# A Special Offer

## A LEATHER CARRYING CASE with FLASK OF HORLICK'S LUNCH TABLETS.

May be attached to the handle-bars or in any other convenient position by means of the two neat straps. Actual size of case closed is 3½ in. x 5 in. x 1½ in. deep.

By post complete for 2/6

The Leather Case is strongly made in solid leather, is excellently finished, and may be attached to the handle-bars or in any other convenient position, so that the Flask may be removed for use at a moment's notice, thus making it possible to carry full nutriment in a light and palatable form

Also a New and Accurate Road Map of ENGLAND & WALES in Leatherette Case, with Roads shown in Colours and Classified, will be sent FREE with this Case and Flask.

The Flask holds enough Tablets for a day's run. A few dissolved in the mouth from time to time will supply the necessary nutriment to maintain strength and vigour and prevent thirst.

*Horlick's Malted Milk Lunch Tablets have been very extensively supplied to the Expeditionary Forces both direct and through the War Office.*

Also in Sterilised Glass Bottles, from which these Flasks may be refilled, 1/6, 2/6 & 11/- at all Chemists and Stores. Send Postal Order, and write plainly, to—**HORLICK'S MALTED MILK CO., SLOUGH, BUCKS.**

# QUESTIONS AND REPLIES

A selection of questions of general interest received from readers and our replies thereto. All questions should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, London, E.C., and whether intended for publication or not must be accompanied by a stamped addressed envelope for reply. Correspondents are urged to write clearly and on one side of the paper only, numbering each query separately, and keeping a copy for ease of reference. Letters containing legal questions should be marked "Legal" in the left-hand corner of envelope, and should be kept distinct from questions bearing on technical subjects.

## A Debate in a Dug-out.

Recently we had a debate in our dug-out about the small two-stroke machine. One section said that it has no valves, and the other section said it has. We have agreed to stand by your answer in the matter, so shall be glad if you can settle the matter for us.—R.A.M.C.

The small two-stroke has no valves. The mixture is taken into the engine and the exhaust gases allowed to escape through ports which the piston covers and uncovers in its travel. It is, however, quite possible to construct a two-stroke with valves.

## An Extra Air Inlet.

My motor cycle is fitted with a B. and B. carburetter, and I wish to fit a lever or tap so as to admit extra air when possible. Shall I be right in fitting this in the induction pipe? If not, where would you suggest it being fitted? What kind of a lever would you recommend? I might add that the smallest possible jet is fitted, and the machine will take full air with the throttle a quarter open.—B.H.N.

You would be quite in order fitting a tap as suggested on your induction pipe. The only thing we should advise you to be careful about is that the tap itself and all joints in connection therewith are perfectly airtight. The ordinary tap handle, if accessible, should suffice.

## The Question of Plug Gaps.

I use the plugs recommended by the makers of my machine. The central electrode in these plugs is a very thin wire, and when central it is approximately  $\frac{1}{16}$  in. from the earthed electrode, which entirely surrounds it. Is this distance too great to get a spark, and, if so, will you kindly inform me at what distance the centre wire should be to get the best results? In cleaning the plugs the centre electrodes have bent (as they are very thin), and I am now in doubt as to their correct adjustment.—W.H.F.

The correct plug gap varies considerably, according to the engine in which the plug is used. Some engines will fire best with the points almost touching, most like a gap of about half a millimetre, and others even will fire best with a gap of a full millimetre. One-eighth of an inch is much too great, and would be likely to cause extremely difficult starting. A machine having a magneto run at engine speed would probably take a much larger plug gap.

## Oily Engine.

(1.) Why does the engine throw oil around the crankshaft, and what remedy is there? (2.) Would a hollow crankshaft not afford sufficient release for the crank case compression? (3.) Do you think it is necessary to fit an additional release, and where would be the most suitable place? (4.) Would you tell me the reason of smoke coming from the crank case through the engine-shaft? (5.) Could an amateur be trusted to dismantle the flywheels and reassemble them?—H.M.L.

(1.) The usual cause of oil throwing out of the bearings is either worn bearings or inefficient crank case release. This causes considerable pressure in the crank case, and forces the oil out of any doubtful joint. The trouble might be cured by fitting an additional release valve of normal type, such as can be obtained from most accessory dealers. Then, if you still get leakage from the bearings, you will know that these require attention. (2.) It certainly ought to. (3.) There seems to be no alternative. It might be fitted to any convenient place near the top of the crank case. (4.) The smoke is the smoke of overheated oil, burned through contact with piston top. (5.) Not unless he was unusually skilled.

## Uneven Running when Running Light.

My 1913 7-9 h.p. Indian has a slight defect which I cannot trace. When pulling uphill or running hard on level, the engine runs perfectly, but when running light or on pilot jet in free the engine seems to misfire slightly.—A.H.

It is possible that the mixture is too strong, with the result that the engine fires regularly under load, but runs unevenly when free or downhill. To get over the difficulty of the front cylinder running faster than the rear one, we would suggest that you examine the carbon brushes, and, if necessary, remove any grease or oil which may have collected thereon. It would also be as well to examine the front inlet valve dome and valve guides to see if there are any air leaks, which would make the mixture weaker in that cylinder. Uneven oiling might cause the difference; see that the front cylinder obtains plenty of lubrication, also check the timing of the front cylinder. The mixture for slow running can be corrected by means of the small adjustable air inlet on top of the pilot jet tube; altering this while the engine is running will probably correct the slight misfire. For good slow running a fairly large plug point gap is required—about  $\frac{1}{32}$  in.

To many of our readers who are in the trenches this scene will recall memories of the days of the autumn shoots and the tramps across the moors with a beloved hammerless ejector and the dogs at heel. The photograph shows a Lowland keeper and a rider of a 7-9 h.p. Abingdon admiring the puppies.

## To the Trade.

**"SHELL"**  
**"SHELL" II**

# MISCELLANEOUS ADVERTISEMENTS.

## PRICES.

ADVERTISEMENTS in these columns—First 12 words or less 1/6, and 3d. for every two words after. Each paragraph is charged separately. Name and address must be counted. Series discounts and special terms to regular trade advertisers will be quoted on application.

Postal Orders sent in payment for advertisements should be made payable to **ILIFFE & SONS Ltd., and crossed** & Co.

All advertisements in this section should be accompanied with remittance, and be addressed to the offices of "The Motor Cycle," Hertford Street, Coventry. To ensure insertion letters should be posted in time to reach the offices of "The Motor Cycle," Coventry, or London (20, Tudor St., E.C.), by the first post on Friday morning previous to the day of issue.

All letters relating to advertisements should quote the number which is printed at the end of each advertisement, and the date of the issue in which it appeared.

The proprietors are not responsible for clerical or printers' errors, although every care is taken to avoid mistakes.

## NUMBERED ADDRESSES.

For the convenience of advertisers, letters may be addressed to numbers at "The Motor Cycle" Office. When this is desired, the sum of 6d. to defray the cost of registration and to cover postage on replies must be added to the advertisement charge. Only the number will appear in the advertisement. All replies should be addressed, "No. 000, c/o 'The Motor Cycle,' 20, Tudor Street, E.C."

## DEPOSIT SYSTEM.

Persons who hesitate to send money to unknown persons may deal in perfect safety by availing themselves of our Deposit System. If the money be deposited with "The Motor Cycle," both parties are advised of this receipt.

The time allowed for a decision after receipt of the goods is three days, and if a sale is effected we remit the amount to the seller, but if not we return the amount to the depositor, and each party to the transaction pay carriage one way. For all transactions exceeding £10 in value, a deposit fee of 2s. 6d. is charged, when under £10 the fee is 1s. All deposit matters are dealt with at Coventry, and cheques and money orders should be made payable to Iliffe & Sons Limited.

The letter "D" at the end of an advertisement is an indication that the advertiser is willing to avail himself of the Deposit System. Other advertisers may be equally desirous, but have not advised us to that effect.

## SPECIAL NOTE.

Readers who reply to advertisements and receive no answer to their enquiries are requested to regard the silence as an indication that the goods advertised have already been disposed of. Advertisers often receive so many enquiries that it is quite impossible to reply to each one by post.

## MOTOR CYCLES FOR SALE.

## IMPORTANT NOTICE.

Owing to the Christmas Holidays, the issue of "The Motor Cycle" for Dec. 28th must be closed for press earlier than usual. All copy and instructions for Miscellaneous Advertisements in that issue must therefore be in our hands not later than first post on Wednesday, Dec. 20th.

## DEFENCE OF THE REALM ACT.

Under the provisions of the above Act, advertisers requiring workmen, and whose business consists wholly or mainly of engineering or the productions of munitions of war, or substances required for the production thereof, and whose works are situated within 30 miles of London, must include in every such advertisement the words, "No person resident more than 10 miles away, or already engaged on Government work, will be engaged."

Advertisers whose works are situated more than 30 miles from London can only have their announcements inserted with the approval of the Board of Trade, who will allocate to each advertisement a box number, and collect and distribute to the advertiser all replies received. The necessary forms of application can be obtained from any Labour Exchange or from the offices of this paper, and each advertisement must contain a clear reference to the effect that no person already engaged on Government work need apply.

## MOTOR CYCLES FOR SALE.

## OF STANLEY SPARES."

REALISING the fact that "a stitch in time saves nine," we are making it more easy for riders to have at hand a set of our special fittings by putting up an assortment in a neat box.

Both the items pictured here, the STANLEY "SHIELD" and the STANLEY "SPARE LINK" are included, as also a STANLEY FASTENER, and a set of ADJUSTING LINKS. It will be on sale at 3/-; ask your agent to show it you.

The STANLEY "SHIELD" protects the belt fastener, prevents wear of the pulley, and conserves power. The STANLEY "SPARE LINK" is the best belt length adjuster yet invented. The "STANLEY" FASTENER with the BEND that NEVER BREAKS, 8d. The "LION" FASTENER—CHEAP yet RELIABLE, Guaranteed 5,000 miles. STANLEY ADJUSTING LINKS, for adjusting the length of your belt in one second. 6d. set of 3.

STANLEY BELTING, 1 in. 1/3, 1 in. 1/6, 1 in. 1/8, 1 in. 1/4, 1 in. 2/5 per foot, plus 10 %.

New Booklet sent on request by postcard.

## STANLEY MOTOR BELT AND FASTENER CO.

(Stanley Webb, Manager).

(Inventors of the Original Hook Belt Fastener and other practical Belt Aids).  
BROMLEY, KENT.

## IGNITION MAGNETS AND ALL SPARE PARTS

If other people can't keep promises, we can, and we do not tinker with your machine, but repair and absolutely guarantee it at moderate cost, and we will let you know beforehand the day of delivery. Time means money so send your Magneto at once to

THE REPAIRERS,

Wm. MOORE & CO.,  
14, Cannon Street, MANCHESTER. Tel. 2848 City.

## "IMP" SPECIALITIES. PUNCTURE SEALER

## DRUID MARK II.

And the "cause"—

Because the **DRUID** alone perfectly fulfils its shock-absorbing functions—being the **ONLY Fork** which totally absorbs within itself **VERTICAL** and **HORIZONTAL** Shocks.

Your Agent will confirm—or, if preferred, ask us for latest Art Folder—note its contents, then "**DRUID**—equip" YOUR mount.

**A. Drew & Co., Ltd.**  
Leopold Street, B'HAM.

YOU hear  
a lot of  
platitudes  
about plug  
guarantees

in these days, but after all  
the vital matter is the  
question of fulfilment, and  
in that the

## FORWARD

stands pre-eminently.

A wide and generous interpretation is given, and in the exceedingly rare cases where we are called upon to "make good" we do so fully, promptly, and without demur.

You will rarely, very rarely, meet a Forward user who has experienced the need for such demand but, when you do—he will confirm all we say—ask him!

*There are many models in  
the FORWARD range, but  
none more popular than "C."*

Let us send you fuller details.

If the Fastener fails,  
where are you? Well,  
usually miles from a repair  
shop, that's according to the  
general "cussedness" of things!

Where are you?—Well, "stuck up"  
with that which may be the speediest  
bike in the world rendered a "dud" by  
the unreliability of this single fitment!

And you feel your position keenly—  
feel the weight of the bike, too, as you  
push it to the nearest repair shop,  
or, alternatively, the indignity of the  
situation as you endeavour to effect a  
temporary repair!

You can save all this by fitting one  
of the

## FORWARD

range—the fasteners that never  
fail.

There's the Forward—strongest  
of all Fasteners at 1/6.

The KING HOOK—King of the  
Hook Types, at 1/- Detachable,  
1/3 Adjustable; and the  
CHAMPION—the best at its  
price—at 9d. Detachable, 1/-  
Adjustable.

Ask your dealer, and write us  
for Catalogue.

## ARMSTRONG &amp; STURMEY-ARCHER

We have every Armstrong part actually in stock, and also every J.S. Sturmeys-Archer part. Any part can be sent by next post, or we can repair your gear in six hours with tested parts exactly as we are supplying to the British and Allied Governments—and guarantee them.

GEAR REPAIRS in

6 HOURS.

46, Brunswick Street, Edinburgh, 12/12/16.

Dear Sirs,  
My wheel received and is now running all right. Please accept my sincere apology for giving you unnecessary trouble, which might have been saved had I sent my wheel whole.

I am very much indebted to you for your consideration. Please accept my best thanks.  
Yours sincerely,  
J. MILLAR.

Send wheels or parts (carriage paid) clearly labelled with name and address to—

COUNTY ENGINEERING CO.,  
64, Staines Rd.,  
HOUNSLOW  
(L. & S.W.Rly.)

# WAR - TIME TESTIMONY

In War  
as  
In Peace

**THE  
MOTOR CYCLE**

produces  
excellent  
results

and

Maintains  
its  
**Pre-eminence**  
as a  
market place  
for  
**Second-hand  
Bargains**

The rates for paragraph advertisements in *The Motor Cycle* are: First 12 words or less 1/6, and 3d for every additional two words. Each paragraph is charged separately and name and address must be counted. Advertisements should be posted to arrive not later than by first post on FRIDAY morning for the following Thursday's issue. Address *The Motor Cycle*, Coventry, or 20, Tudor Street, London, E.C.

During the war *The Motor Cycle* has enhanced its already high reputation as THE newspaper for motor cyclists. It is read by practically every owner (and intending buyer), whether in the army, navy, air service, or civil life, and is, therefore, the most suitable medium for readers' advertisements of second-hand goods — for sale, wanted, or to be exchanged.

## **Callers on day of publication.**

In respect to my advert. in *The Motor Cycle*, on arriving home on Thursday afternoon I found a gentleman had been waiting two hours to see my machine. Since then I have had 10 APPLICATIONS, and my wife informs me that as early as eleven o'clock on Thursday morning a man came to see the machine.

C. HECTOR PETERS,

13, Mayow Rd., Forest Hill, S.E.

## **An excellent advertising medium.**

I must give *The Motor Cycle* credit for being an excellent advertising medium. Your paper must have been newly published when QUITE A HOST OF OFFERS came for my carburetter, and also offers to supply tank I asked for.

JAMES PAUL,

124, High St., Perth.

## **Sold same day.**

I wish to thank you for inserting the last advert. I sent in place of the one that was too late.

It may interest you to know that the machine was SOLD THE SAME DAY that the advert. appeared. I also had MANY WIRES AND LETTERS.

Undoubtedly *The Motor Cycle* is THE paper for motor cyclists in every way.

J. L. RUTTER,

Newlands Park, Sydenham.

## **Delighted with speedy replies.**

I am delighted with speedy replies received through the medium of your valuable paper, *The Motor Cycle*. Last week, advertising exchange, I have HAD REPLIES EVERY POST, and have suitably exchanged with a satisfied reader.

G. HARROP,

57, Abbeyhill Rd., Oldham.

### I'm sorry

—very sorry—for the unavoidable delay in supplying Motor Cyclists with Beacon Oilskins.

Service Orders are diverting work and material, and though the M. C. production is almost normal many orders have to wait.

If Motor Cyclists will help me to help the National Cause by withholding orders for a month, I shall be grateful.

By the end of December, I expect to fulfil all waiting orders and to be able to deal with fresh ones.

*Malcolm Barbour*

## A change of Oil —

is not the only precaution to take when using Paraffin and other Petrol substitutes in petrol motors.

## We have compiled

from a wide experience with alternative fuels, a budget of notes in which we indicate, and give reasons for, the steps to take to ensure the best results. Lubrication, Cooling, and Carburation all require attention. An interesting publication well worth securing.

Write for Petrol Substitutes Budget and Lists.

# ROYAL RUBY

2 $\frac{3}{4}$  h.p., 4-stroke, 2-speed, Lightweight.

## SPECIFICATION:

**FRAME**—Low built, soundly constructed, and with dropped back, giving low position, 29in. from ground to top of saddle, made throughout of Royal Ruby fittings, specially designed, and best quality weldless steel tubing. **FORKS**—Druid Lightweight (manufactured under Drew's Patent). **ENGINE**—The celebrated J.A.P. 2 $\frac{3}{4}$ h.p., 4-stroke, with A.O. side valves, and adjustable tappets, 70 mm. x 76 mm., with c.e. 292, latest design with large bearings and valves, and gear drive to magneto. **MAGNETO**—Thomson-Bennett gear driven, with variable ignition. **TRANSMISSION**—Combined chain and belt, Hans Renold's chain to countershaft gear, and  $\frac{3}{4}$ in. Dunlop belt to rear wheel. **CHAIN CASE**—Metal detachable as shown. **GEAR**—Albion 2-Speed Countershaft. **CARBURETTOR**—A.M.A.C. or B. and B. **BRAKES**—Bowden front brake, with outside lever and rear belt rim brake, operated by foot. New design as shown with Royal Ruby patent eccentric adjustment. **SILENCER**—Welded steel as shown. **SADDLE**—Middlemore and Lamplugh's Pen Seat, padded top.

**CARRIER**—Tubular, very strong. **TANK**—Specially well-made, holding 1 $\frac{1}{2}$  gallons of petrol and 1 $\frac{1}{2}$  gills of oil, resting on rubber cushions and fastened on two supports brazed to frame. Enamelled in rich Ruby colour and lined in real gold leaf. **LUBRICATION**—From separate chamber in tank through Best and Lloyd's semi-automatic sight feed, with pump. **CONTROL**—Ignition and carburettor levers on handle-bar. Compression release by outside lever worked with Bowden Wire from handle-bar. **HANDLE-BAR**—As shown or semi T.T. (optional). **MUDGUARDS**—Deep section steel, with side shields to front and rear, also belt shield on rear guard. **STAND**—Good rear stand. **WHEELS**—26in. x 2 $\frac{1}{4}$ in. B.E. Rims, well enamelled black, and fitted with good quality hubs. **FOOT-BOARDS**—Royal Ruby patent adjustable. **BAG**—Side Bag. **TOOLS**—Good set of tools in roll. **INFLATOR AND OLPS**—Blenheim's celluloid inflator and clips brazed to frame. **TYRES**—Dunlop 26in. x 2 $\frac{1}{4}$ in. B.E. Rubber-Studded Motocyclelette Tyres.
